21CMMC

- Massively parallel MCMC driver for the EoR simulation code 21CMFAST
- 21CMFAST provides:
 - **full 3D EoR simulations** at a fraction of the computing cost of RT simulations
 - preserves the 3D structure of reionisation (superior to analytic models of EoR)
- Recovers astrophysical parameter constraints from **any model** of the EoR for **any statistical measure** of the 21 cm signal

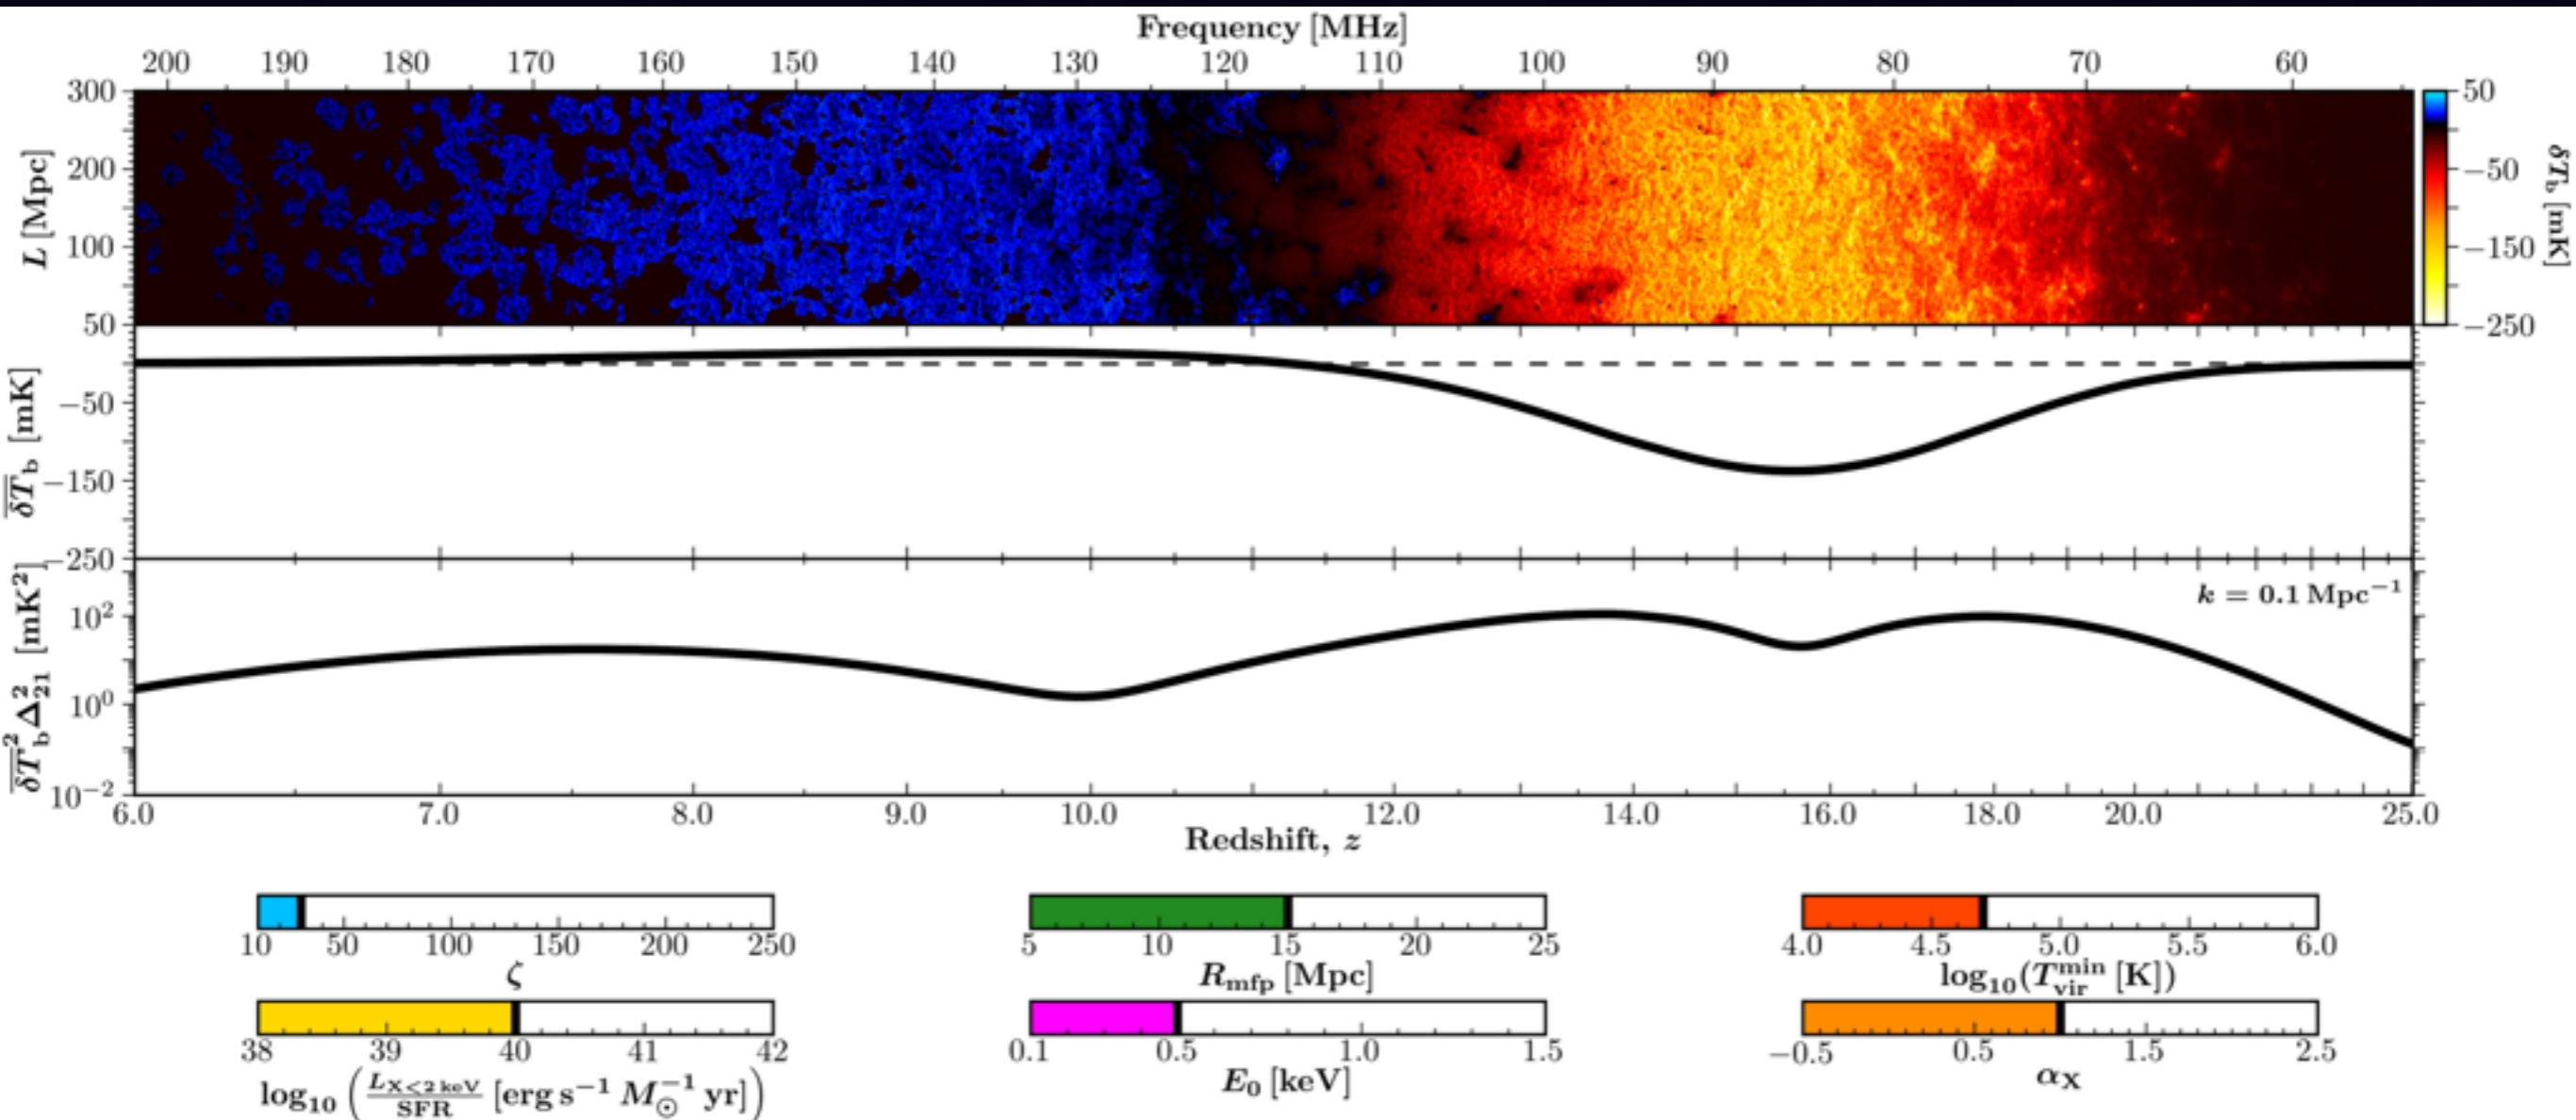

Astrophysical Parametrisation in 21CMMC

- Current implementation contains 6 parameters
- Have 3 parameters describing the EoR
- Another 3 parameters describing the heating (X-ray) epoch
- Assume the same minimum mass threshold for ionisation and X-ray sources

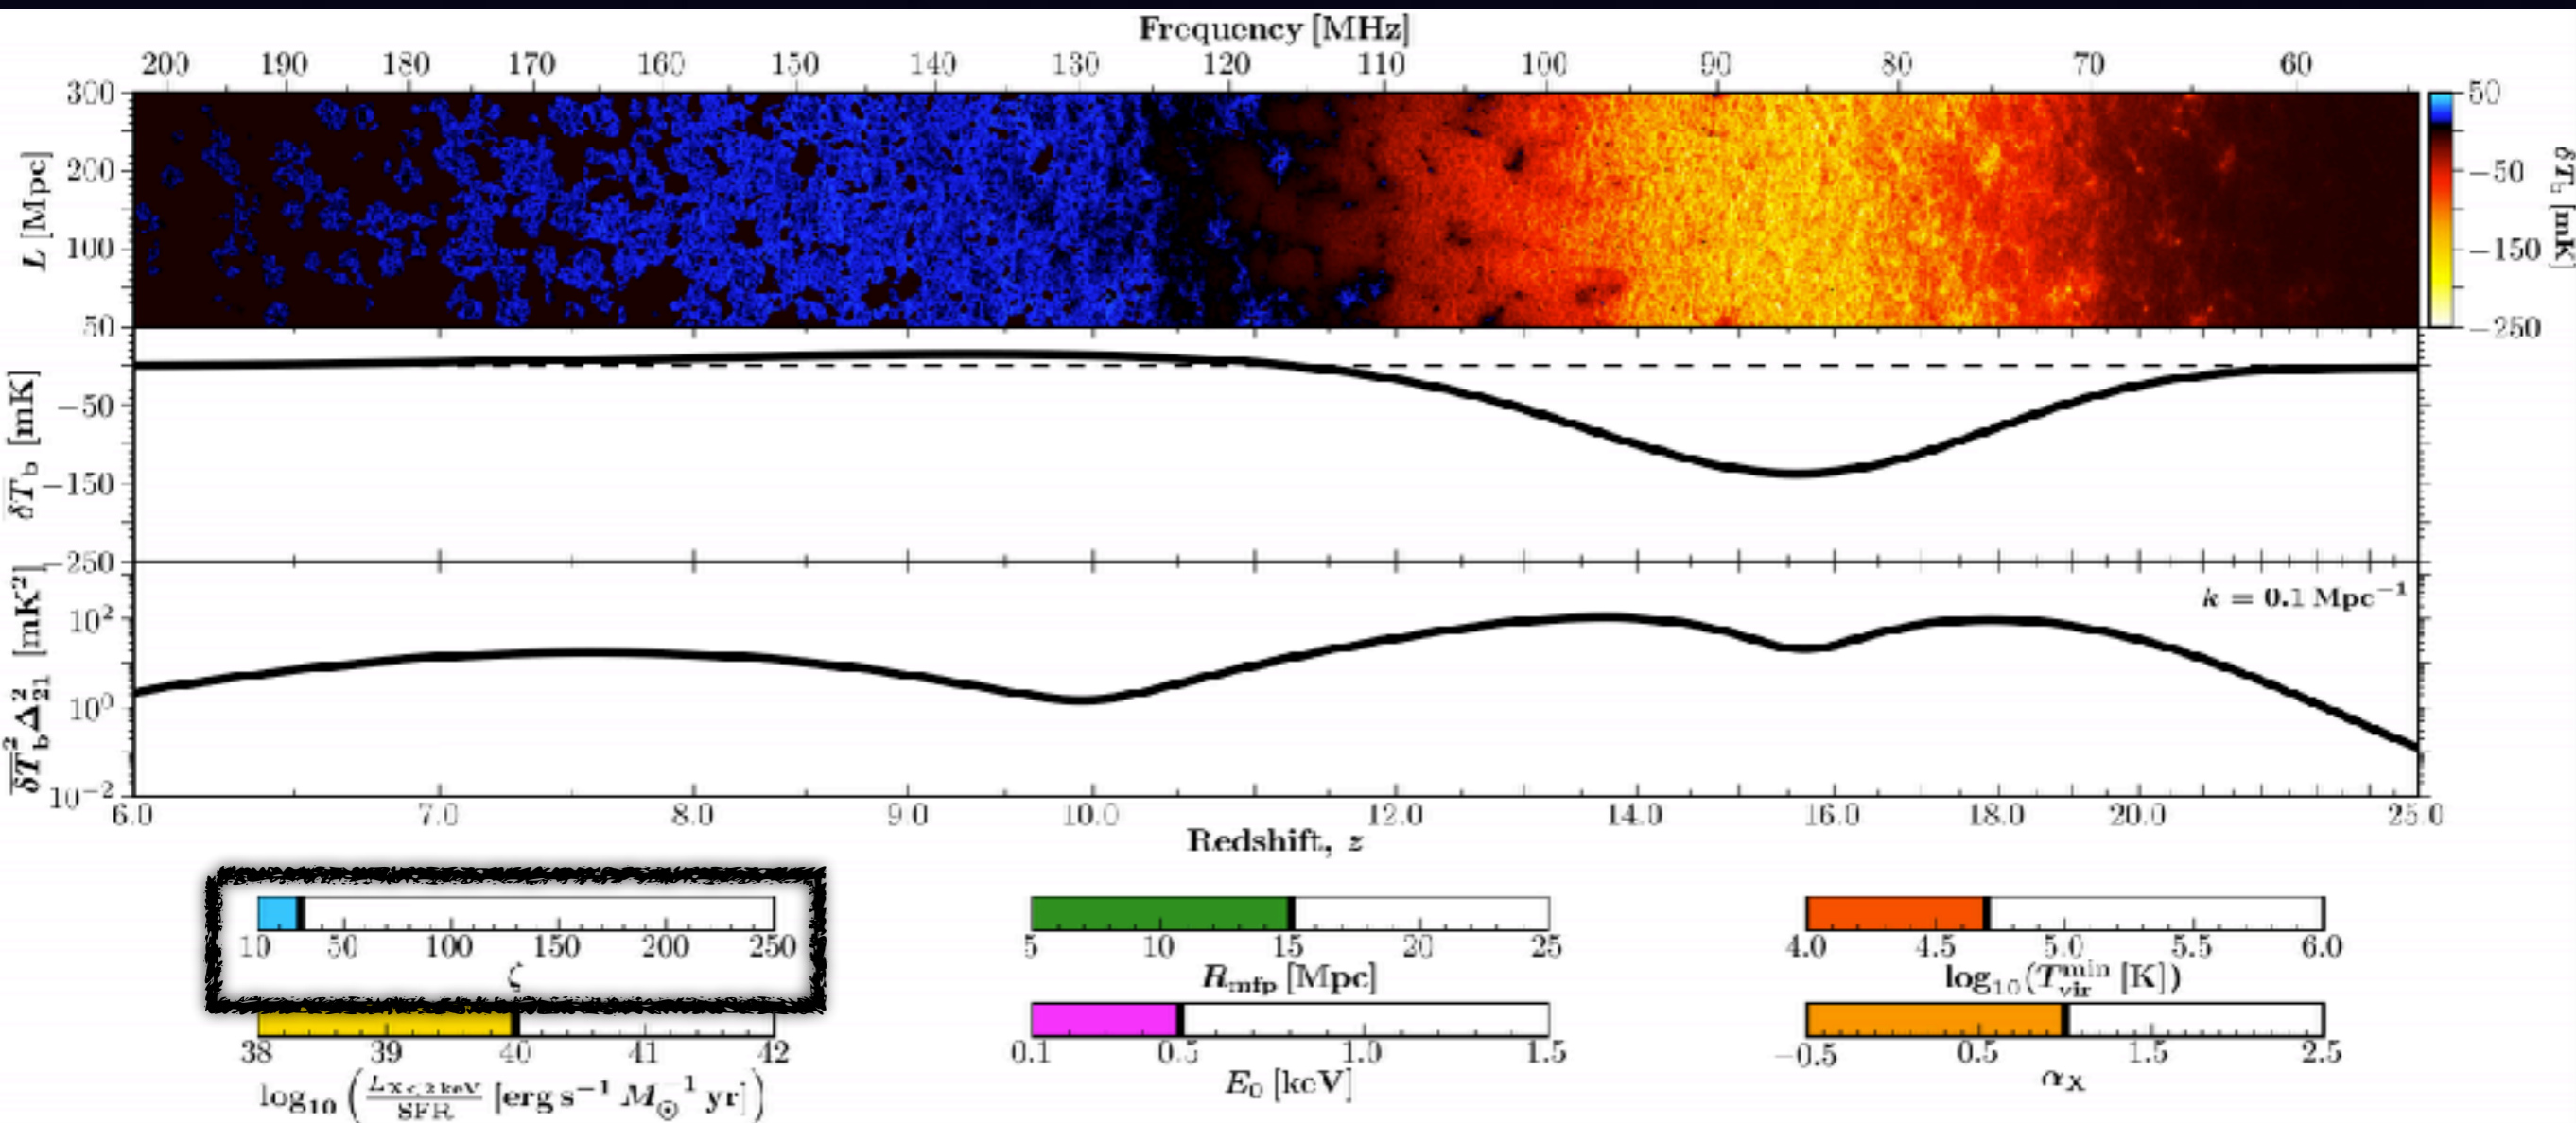

Epoch of Reionisation

ζ : Constant ionising efficiency; $\propto f_{\text{esc}} f_* N_{\gamma/b} (1 + n_{\text{rec}})^{-1}$

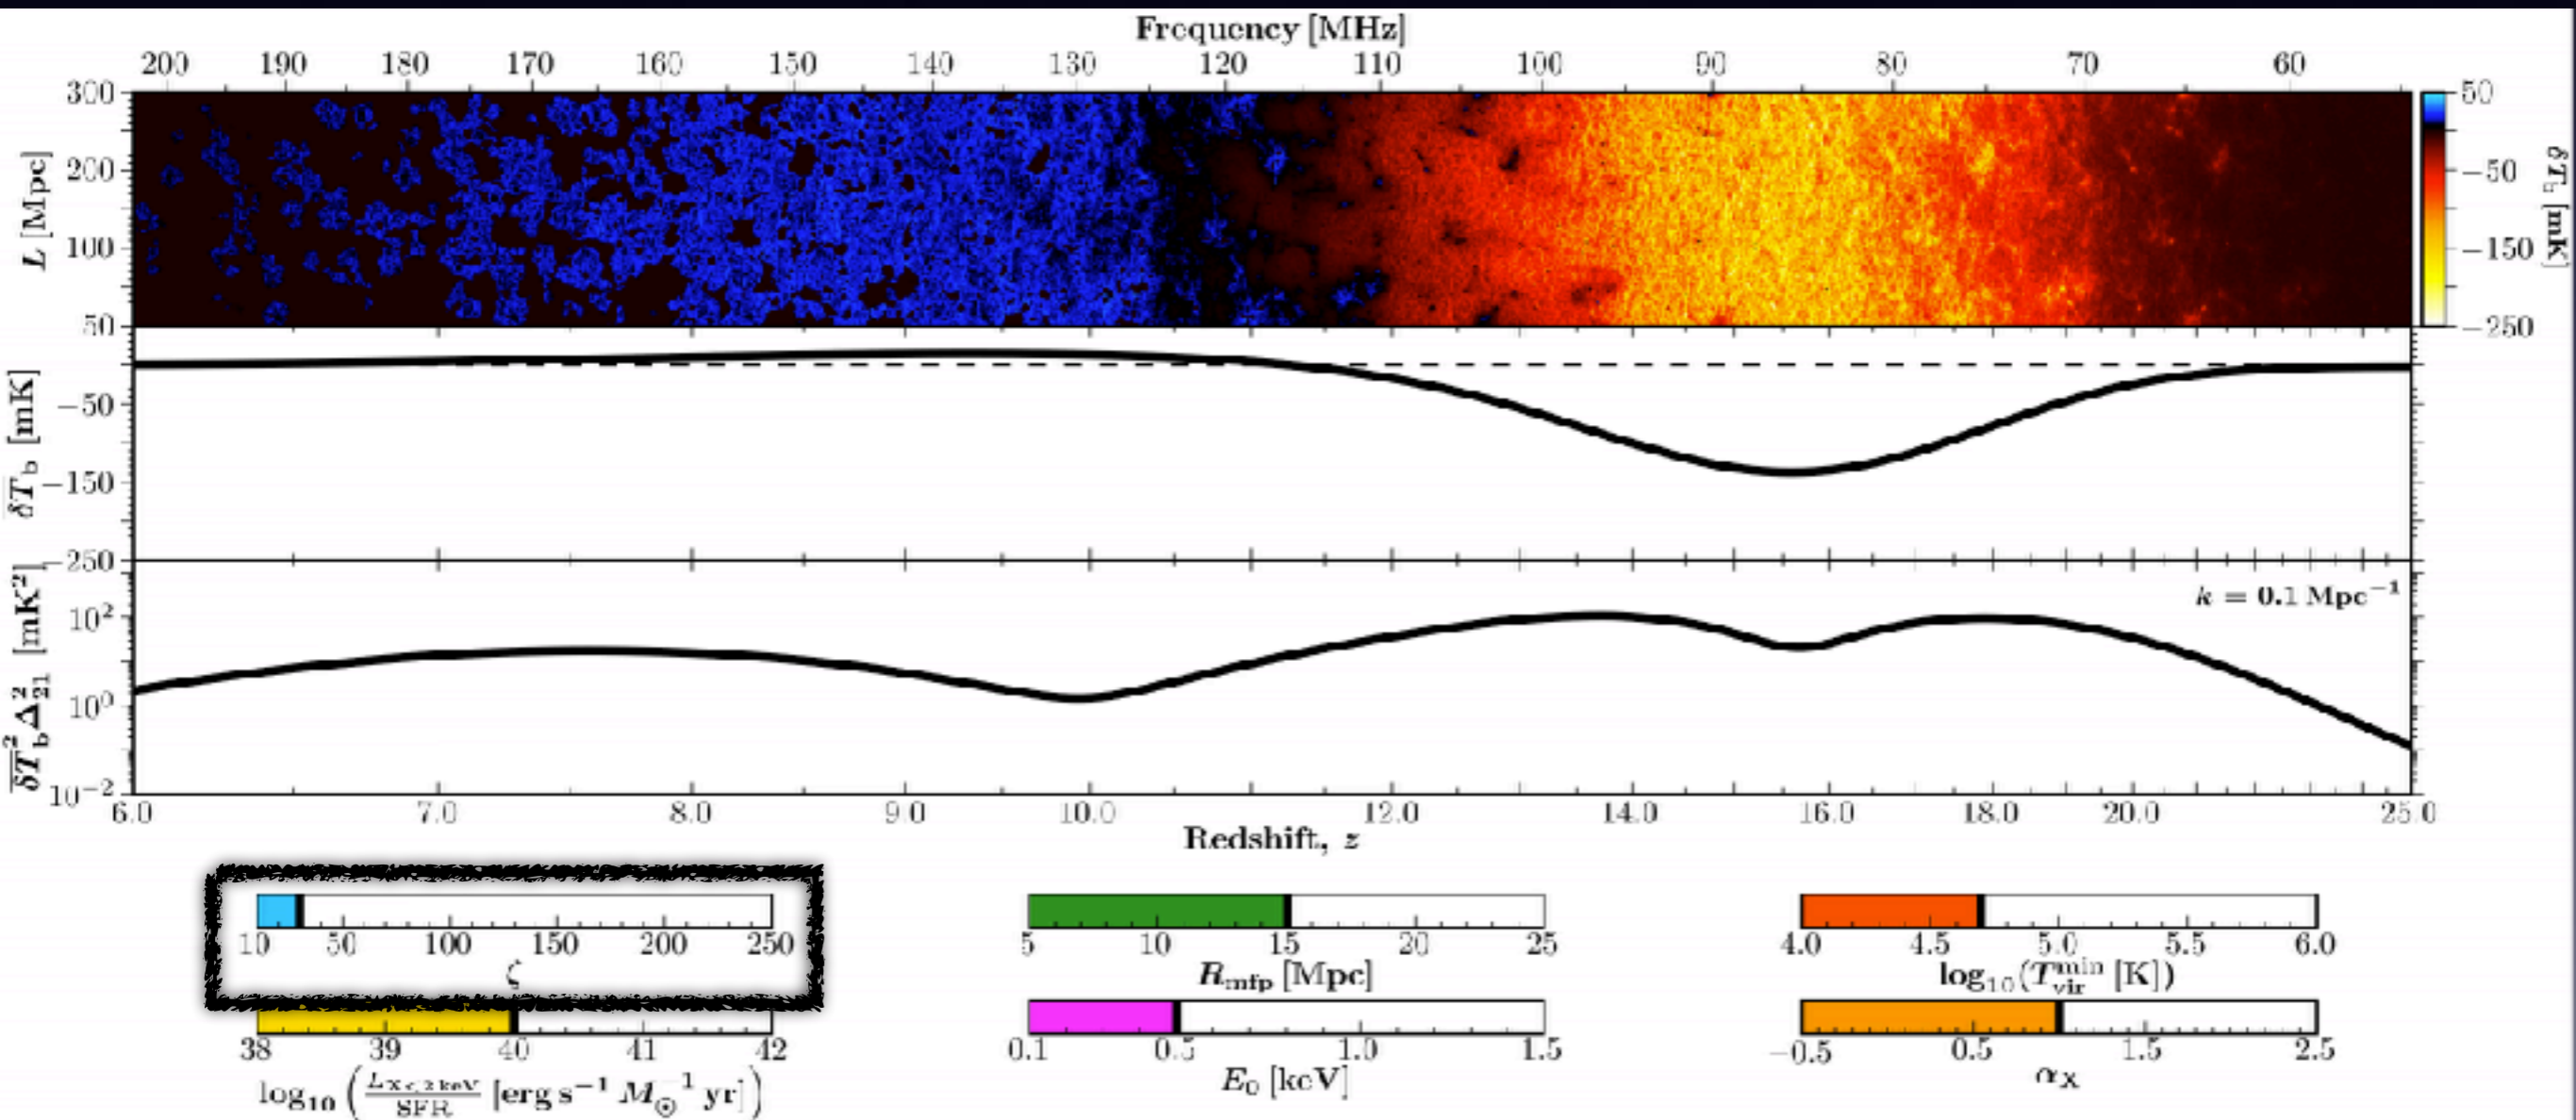

Epoch of Reionisation

ζ : Constant ionising efficiency; $\propto f_{\text{esc}} f_* N_{\gamma/b} (1 + n_{\text{rec}})^{-1}$

Epoch of Reionisation

ζ : Constant ionising efficiency; $\propto f_{\text{esc}} f_* N_{\gamma/b} (1 + n_{\text{rec}})^{-1}$

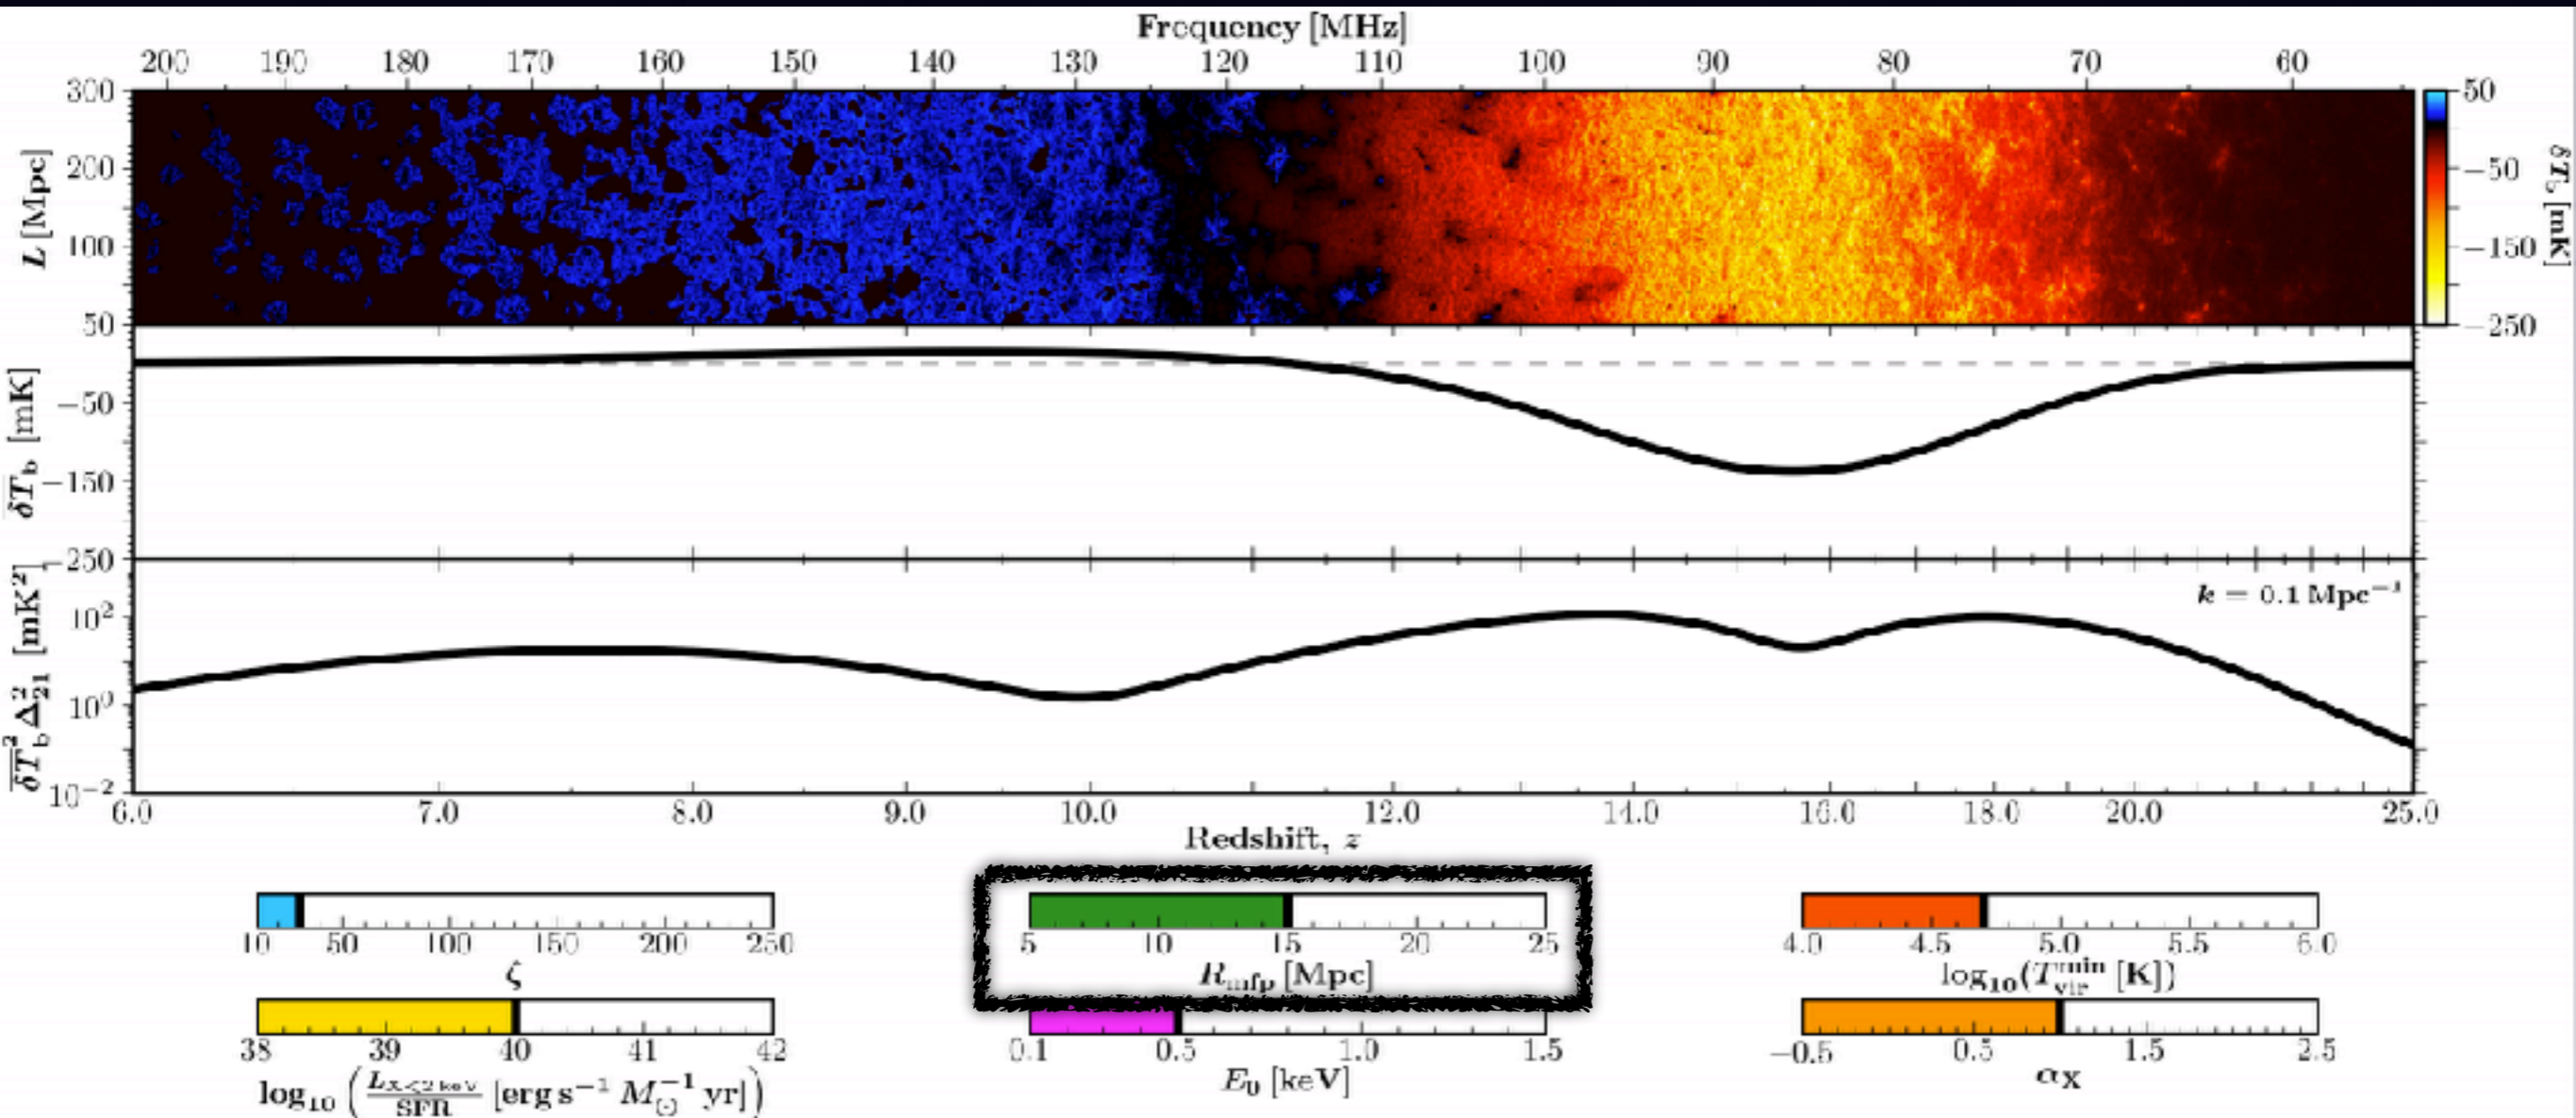

Epoch of Reionisation

R_{mfp} : Maximum horizon of ionising photons

Epoch of Reionisation

R_{mfp} : Maximum horizon of ionising photons

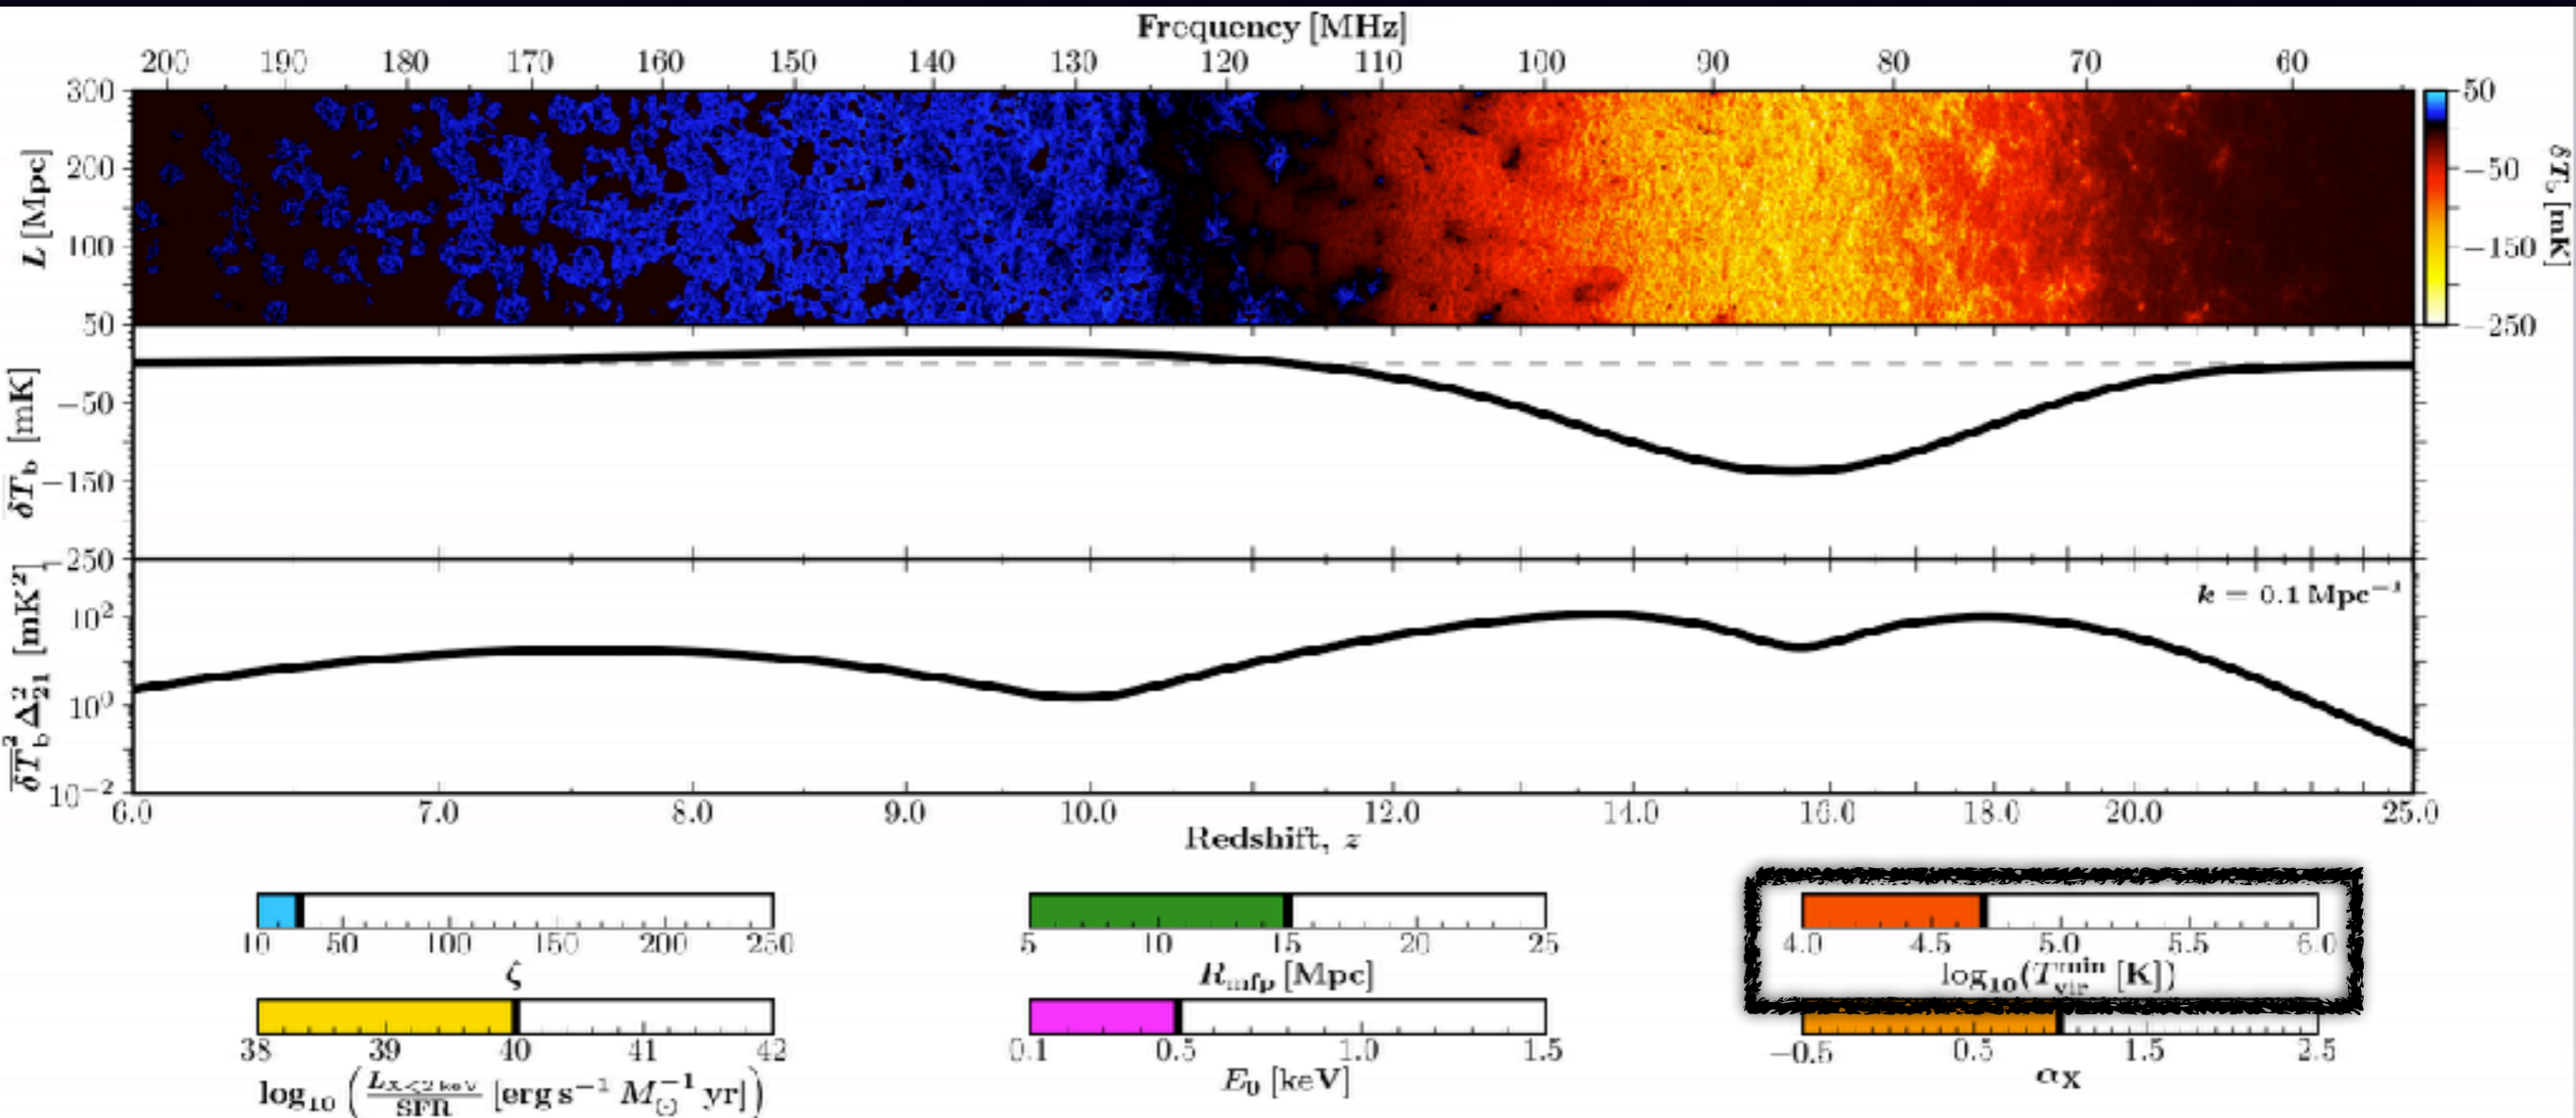

Epoch of Reionisation

T_{vir} : Minimum mass threshold for the formation of star-forming haloes

Epoch of Reionisation

T_{vir} : Minimum mass threshold for the formation of star-forming haloes

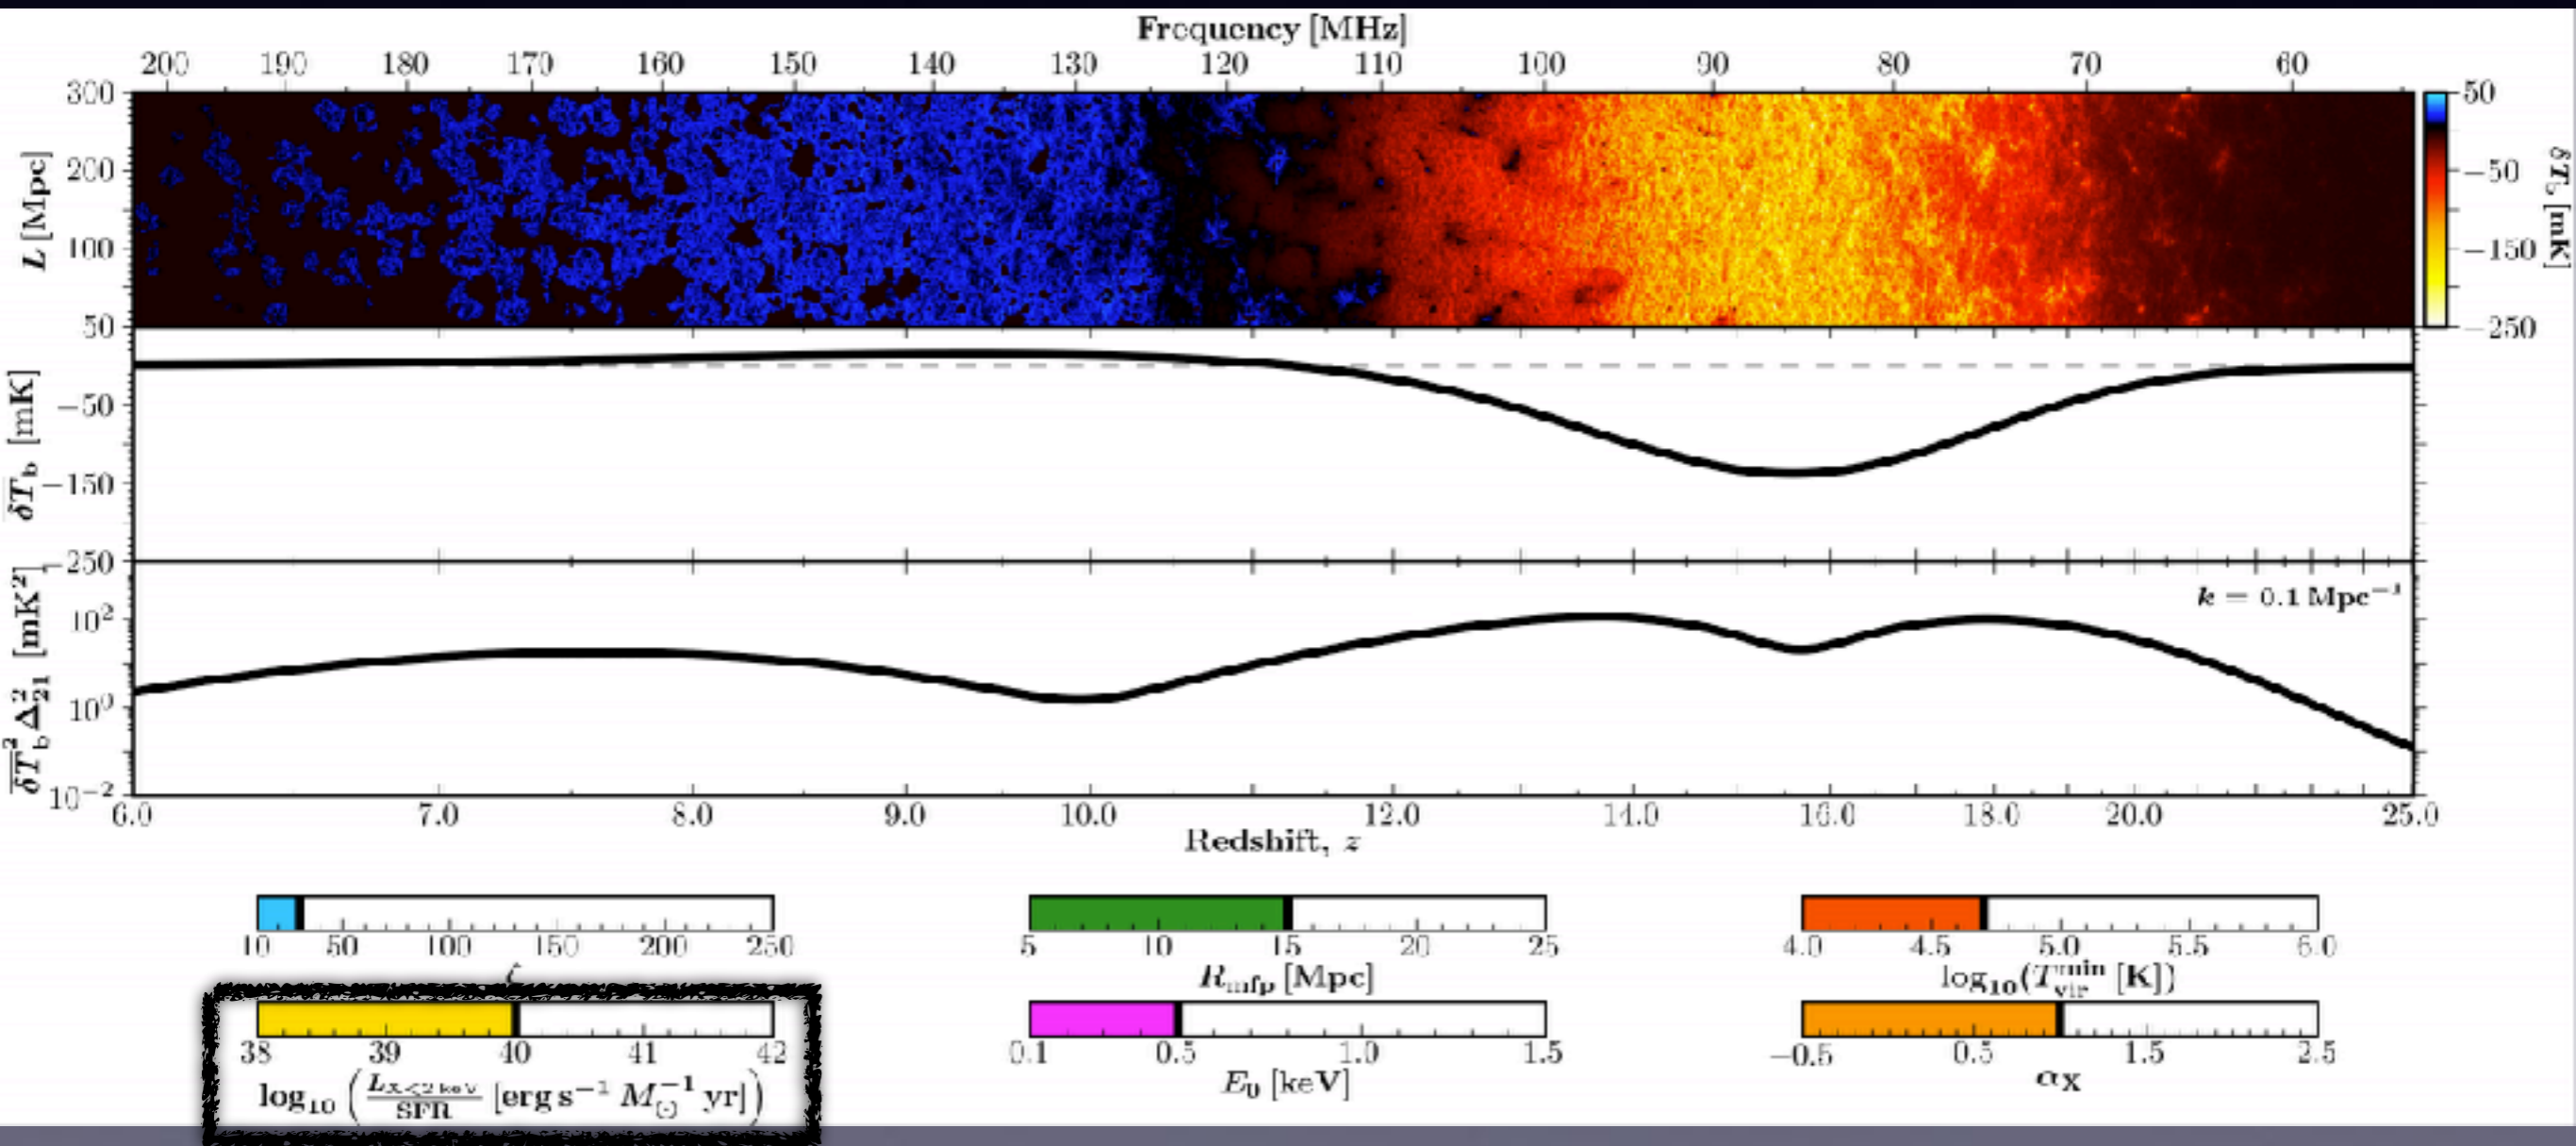

Epoch of (X-ray) Heating

L_x/SFR : Integrated soft-band (<2keV) luminosity of the X-ray sources

Epoch of (X-ray) Heating

L_x/SFR : Integrated soft-band (<2keV) luminosity of the X-ray sources

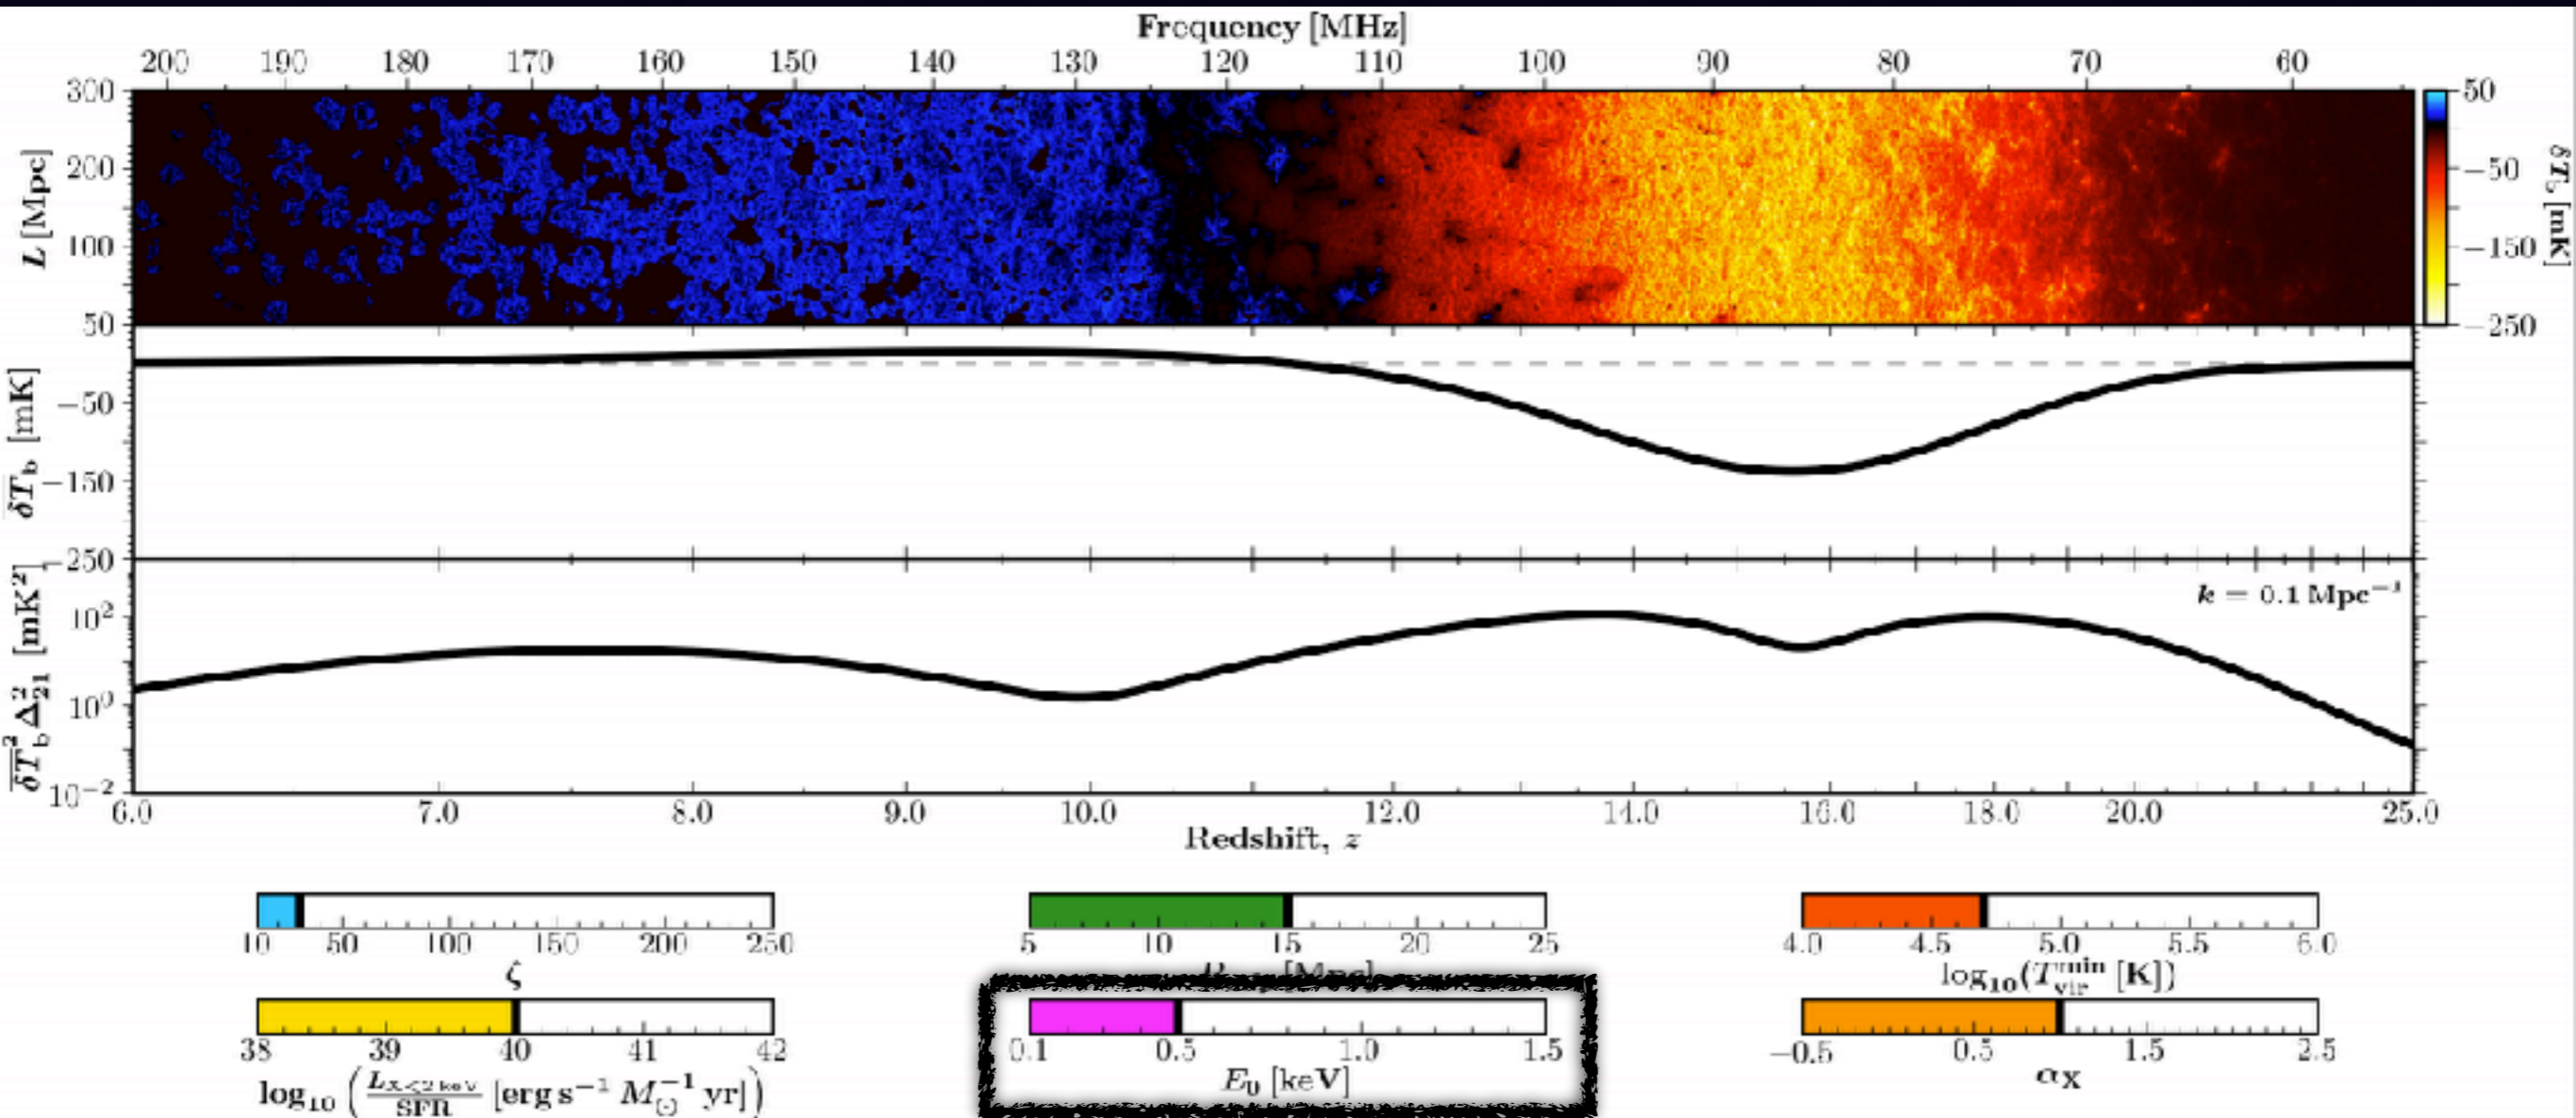

Epoch of (X-ray) Heating

E_0 : energy threshold below which X-ray photons are absorbed by the host galaxy

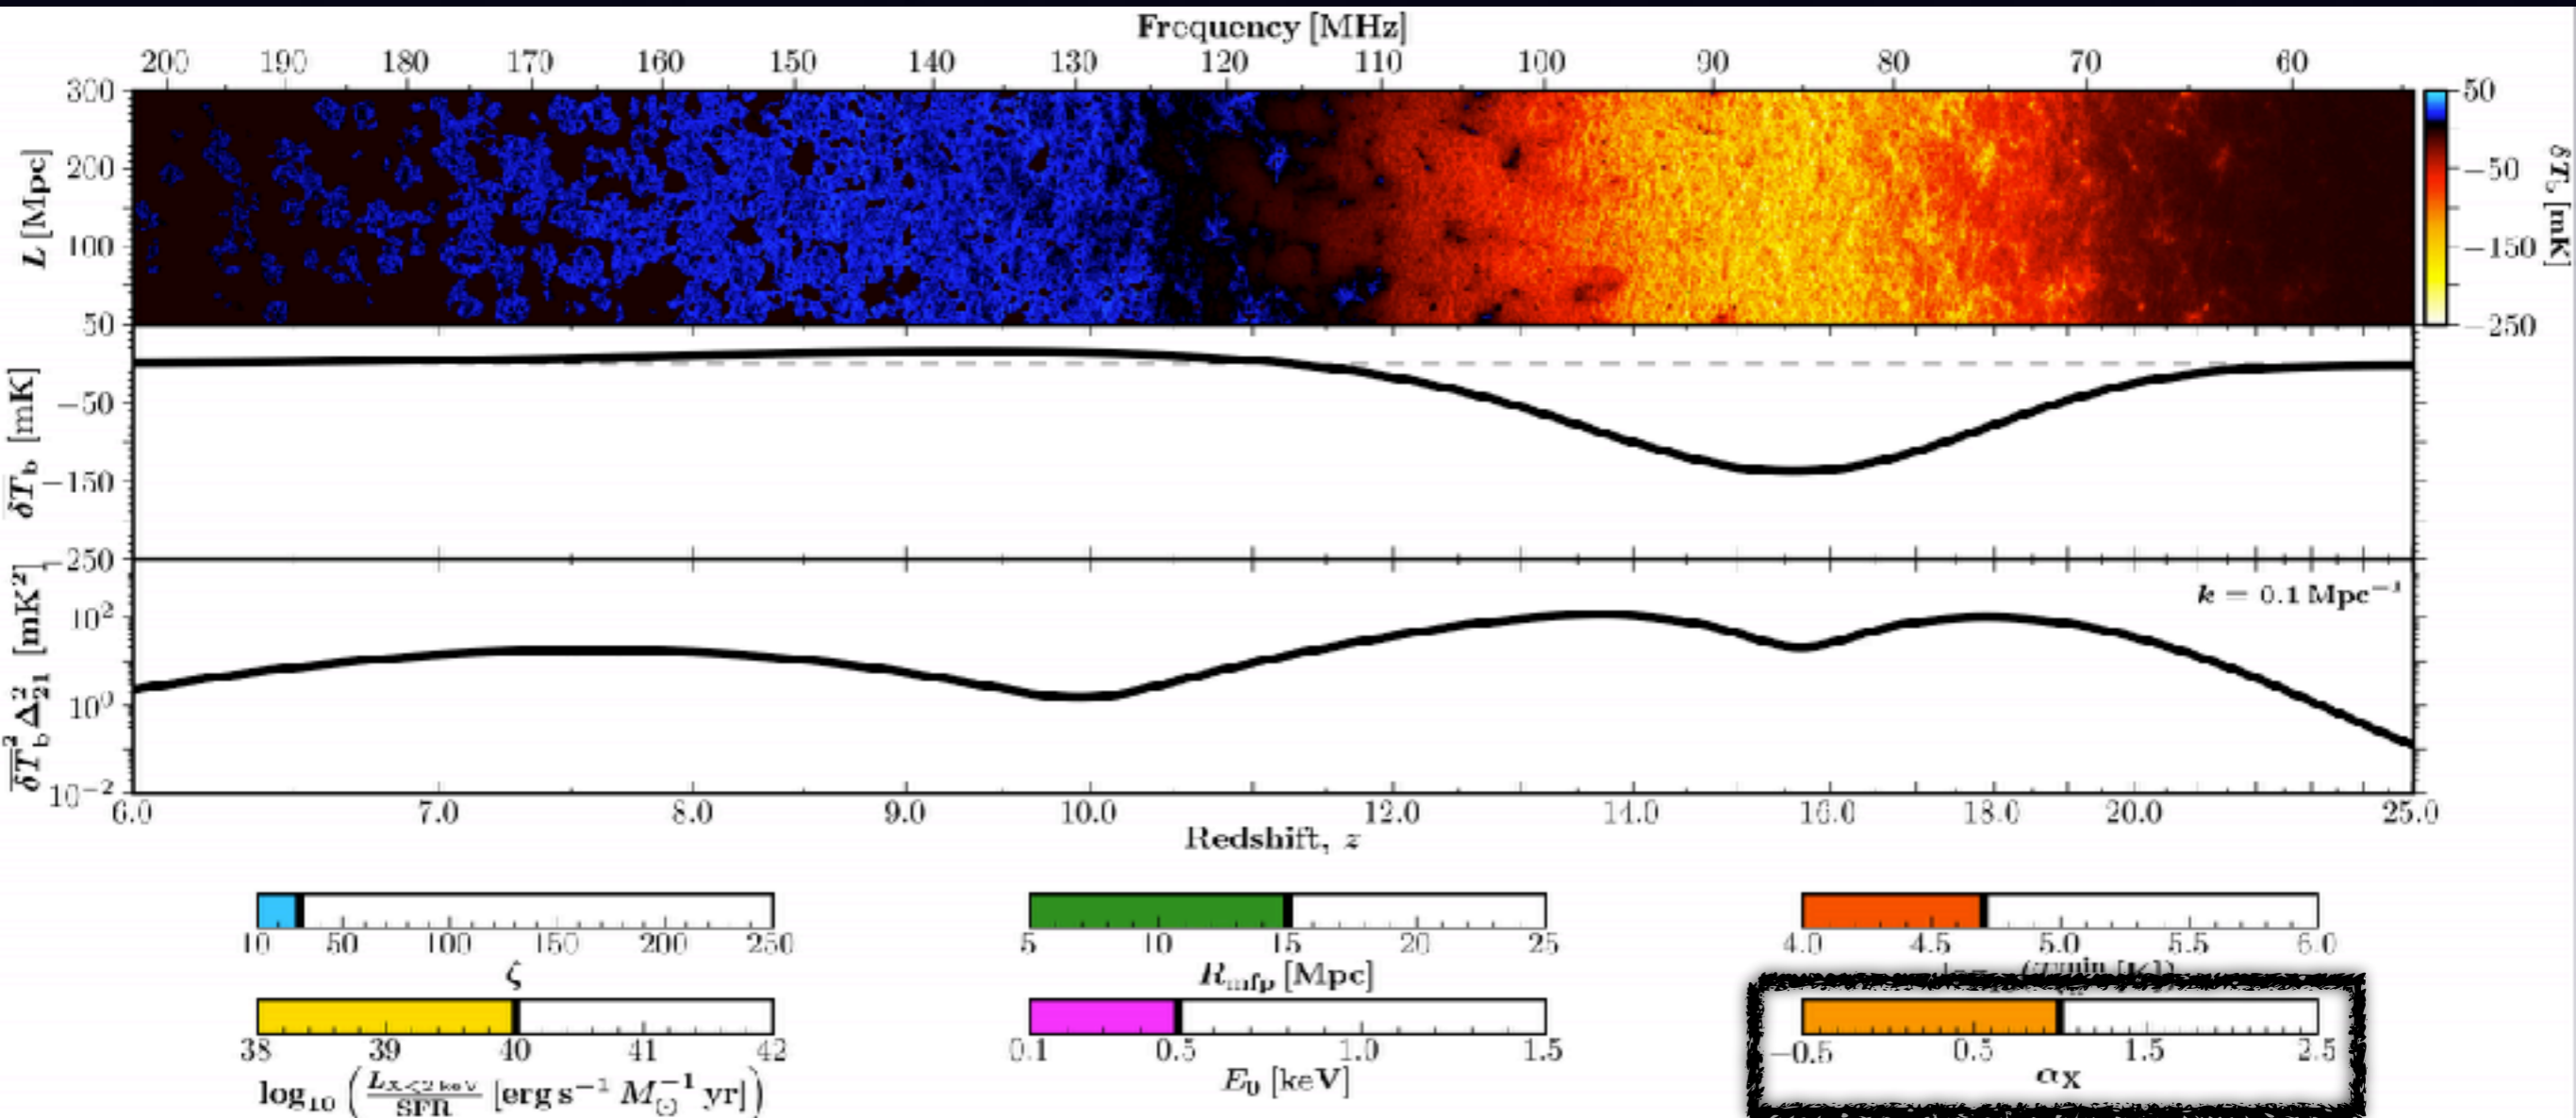

Epoch of (X-ray) Heating

E_0 : energy threshold below which X-ray photons are absorbed by the host galaxy

Epoch of (X-ray) Heating

α_X : The spectral index of the X-ray emission from early galaxies

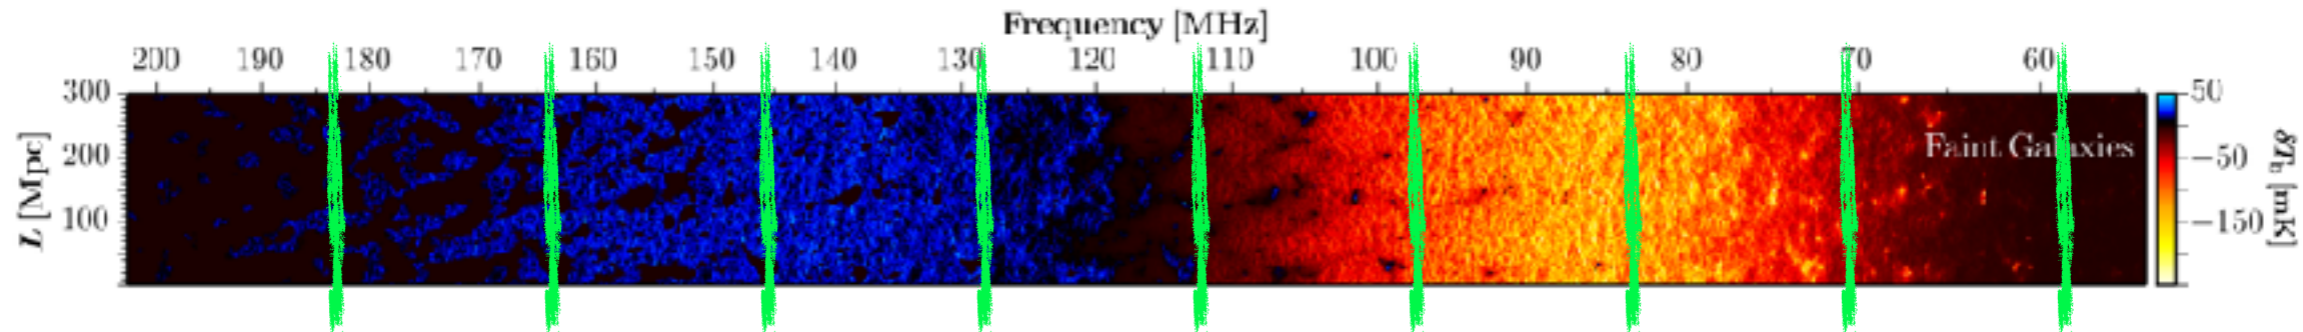

Epoch of (X-ray) Heating

α_X : The spectral index of the X-ray emission from early galaxies

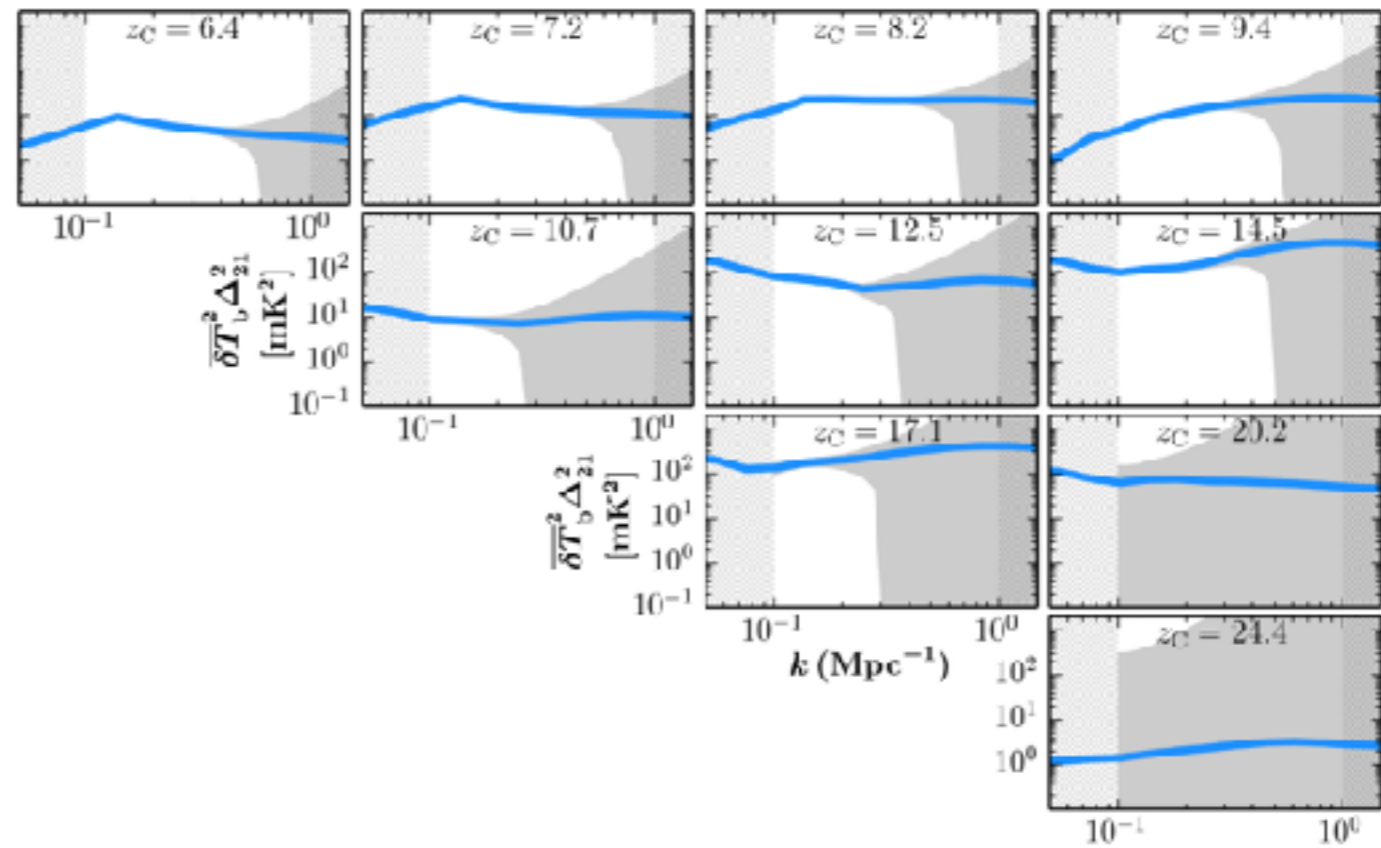

What does 21CMMC do?

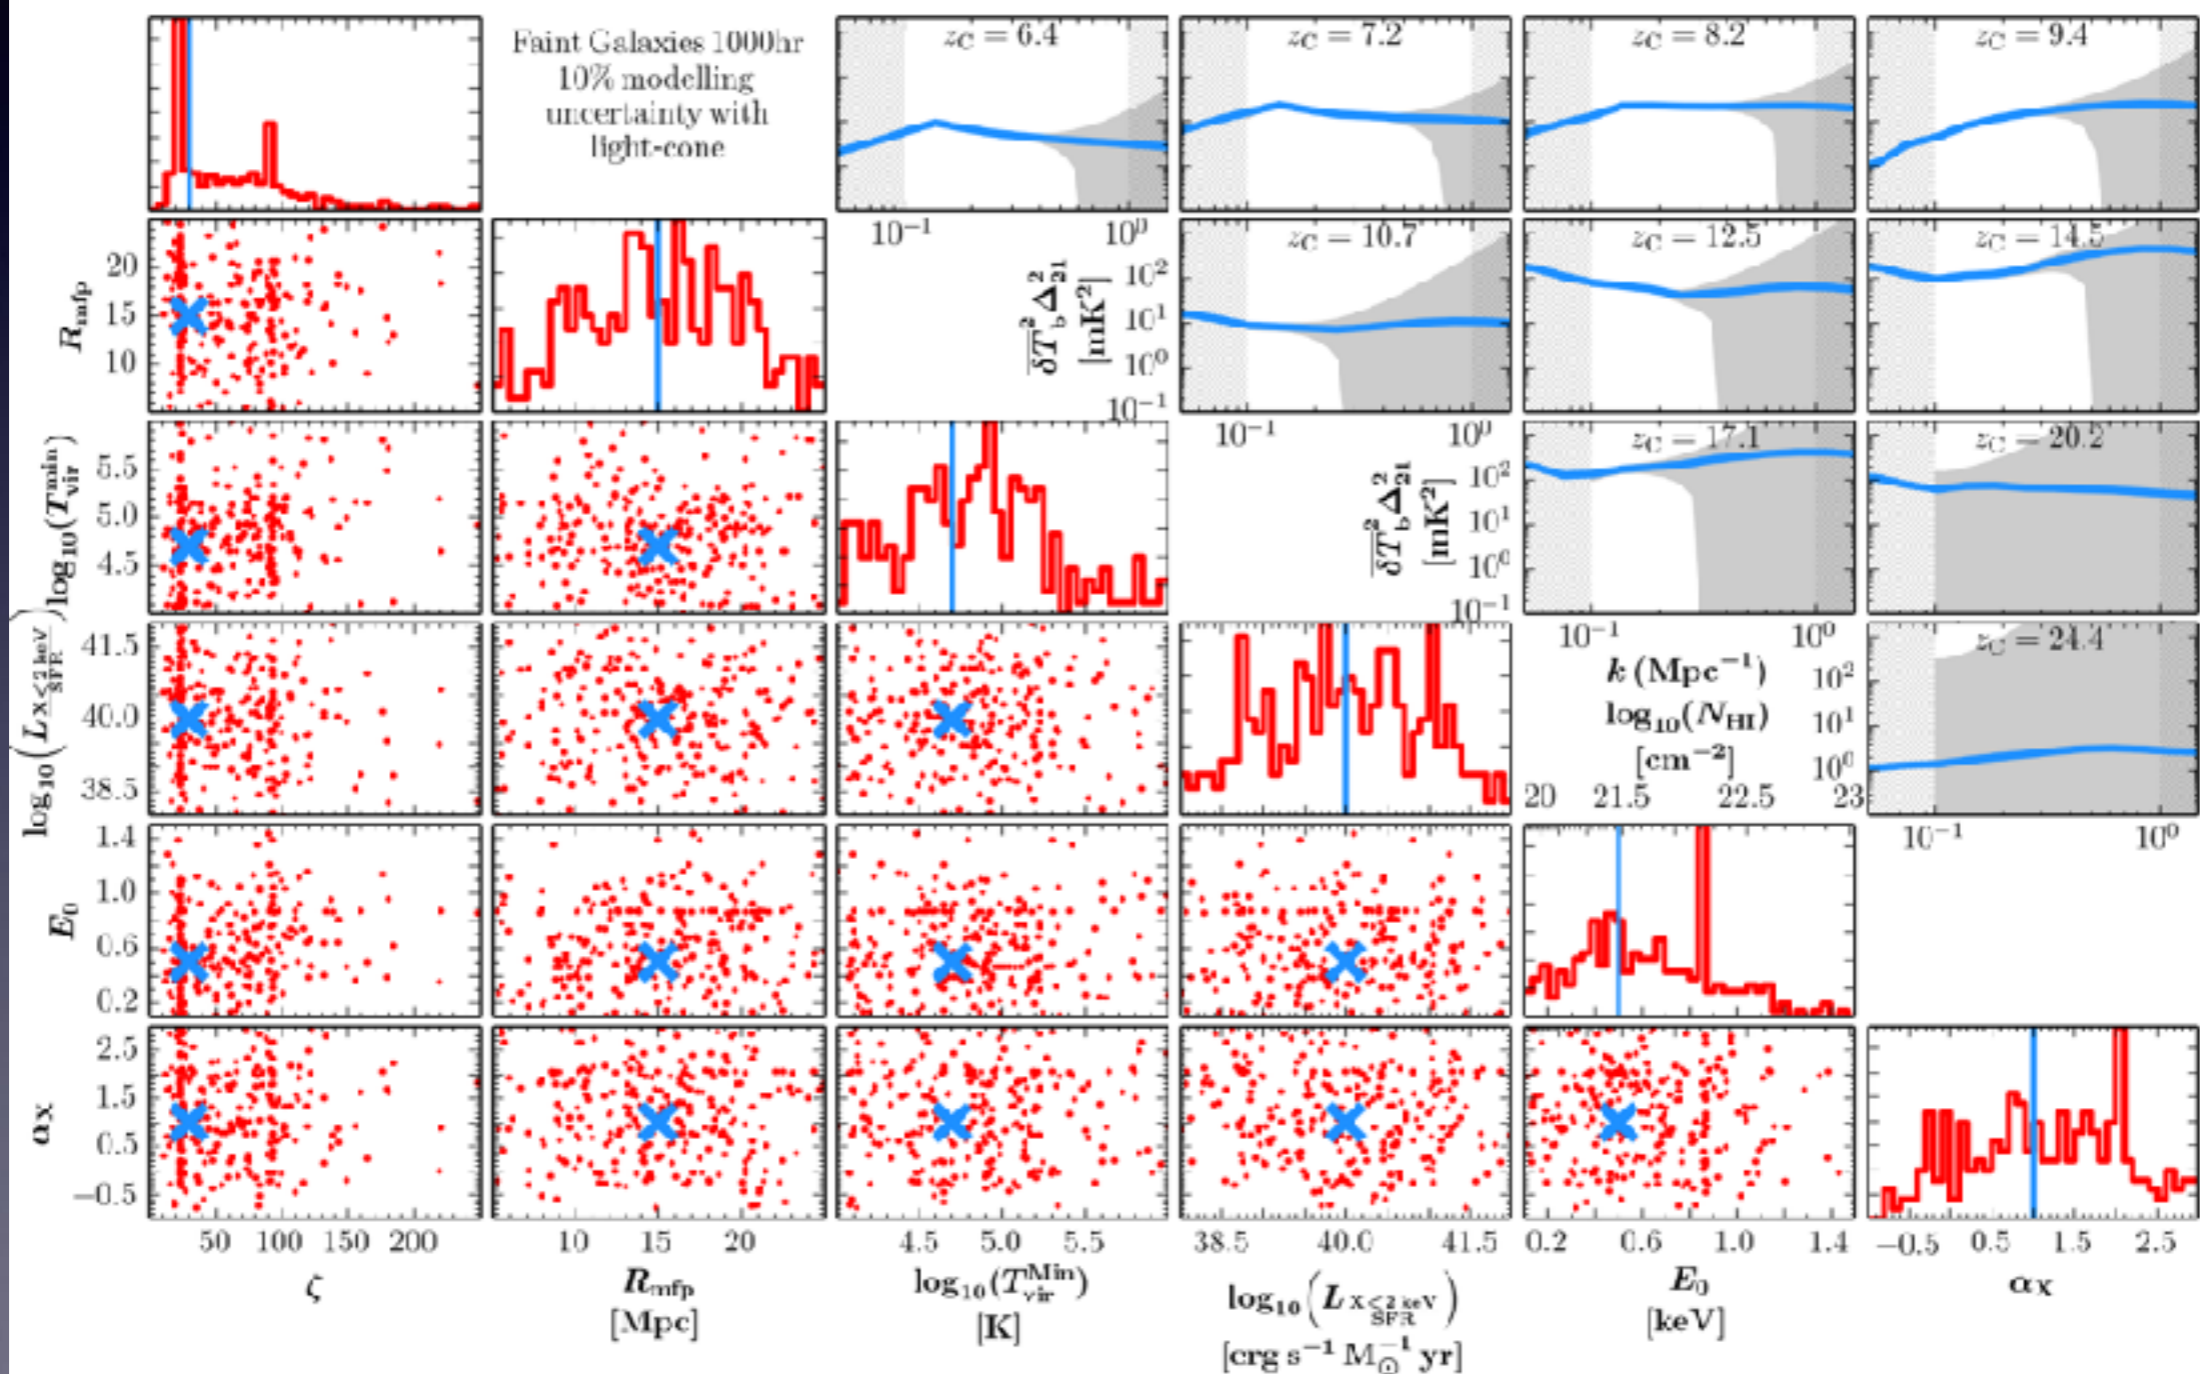

Faint Galaxies 1000hr
10% modelling
uncertainty with
light-cone

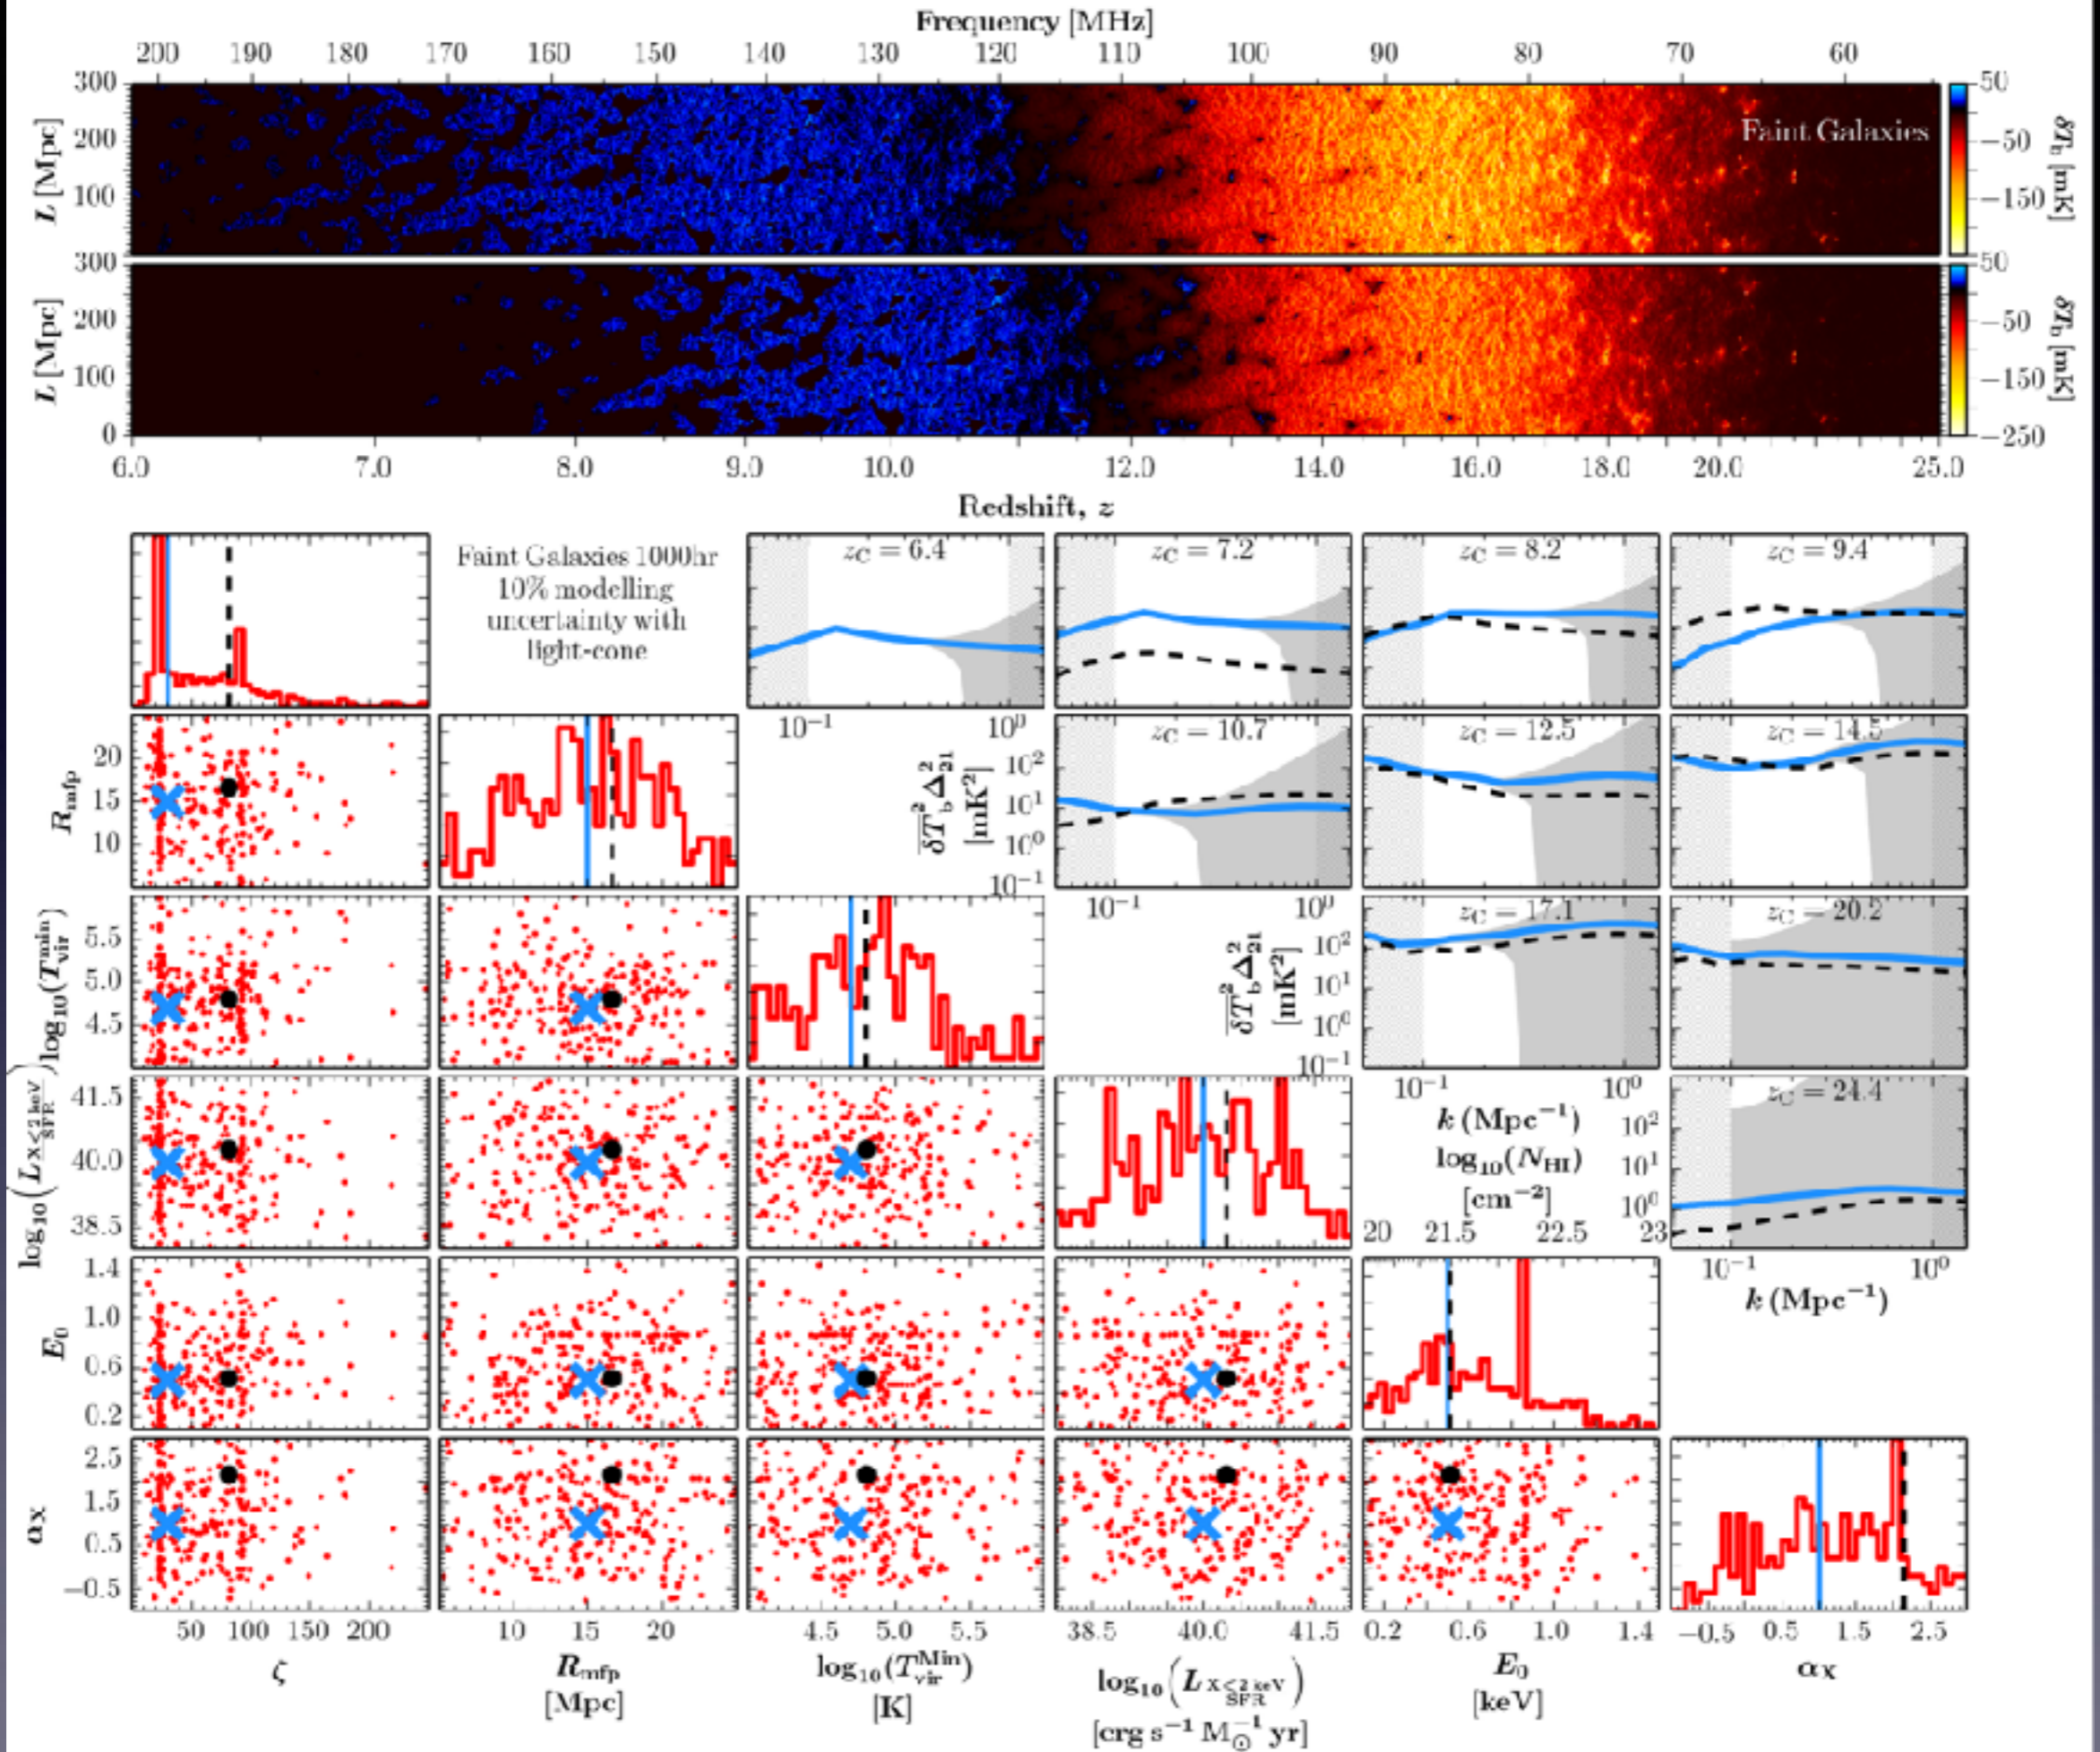

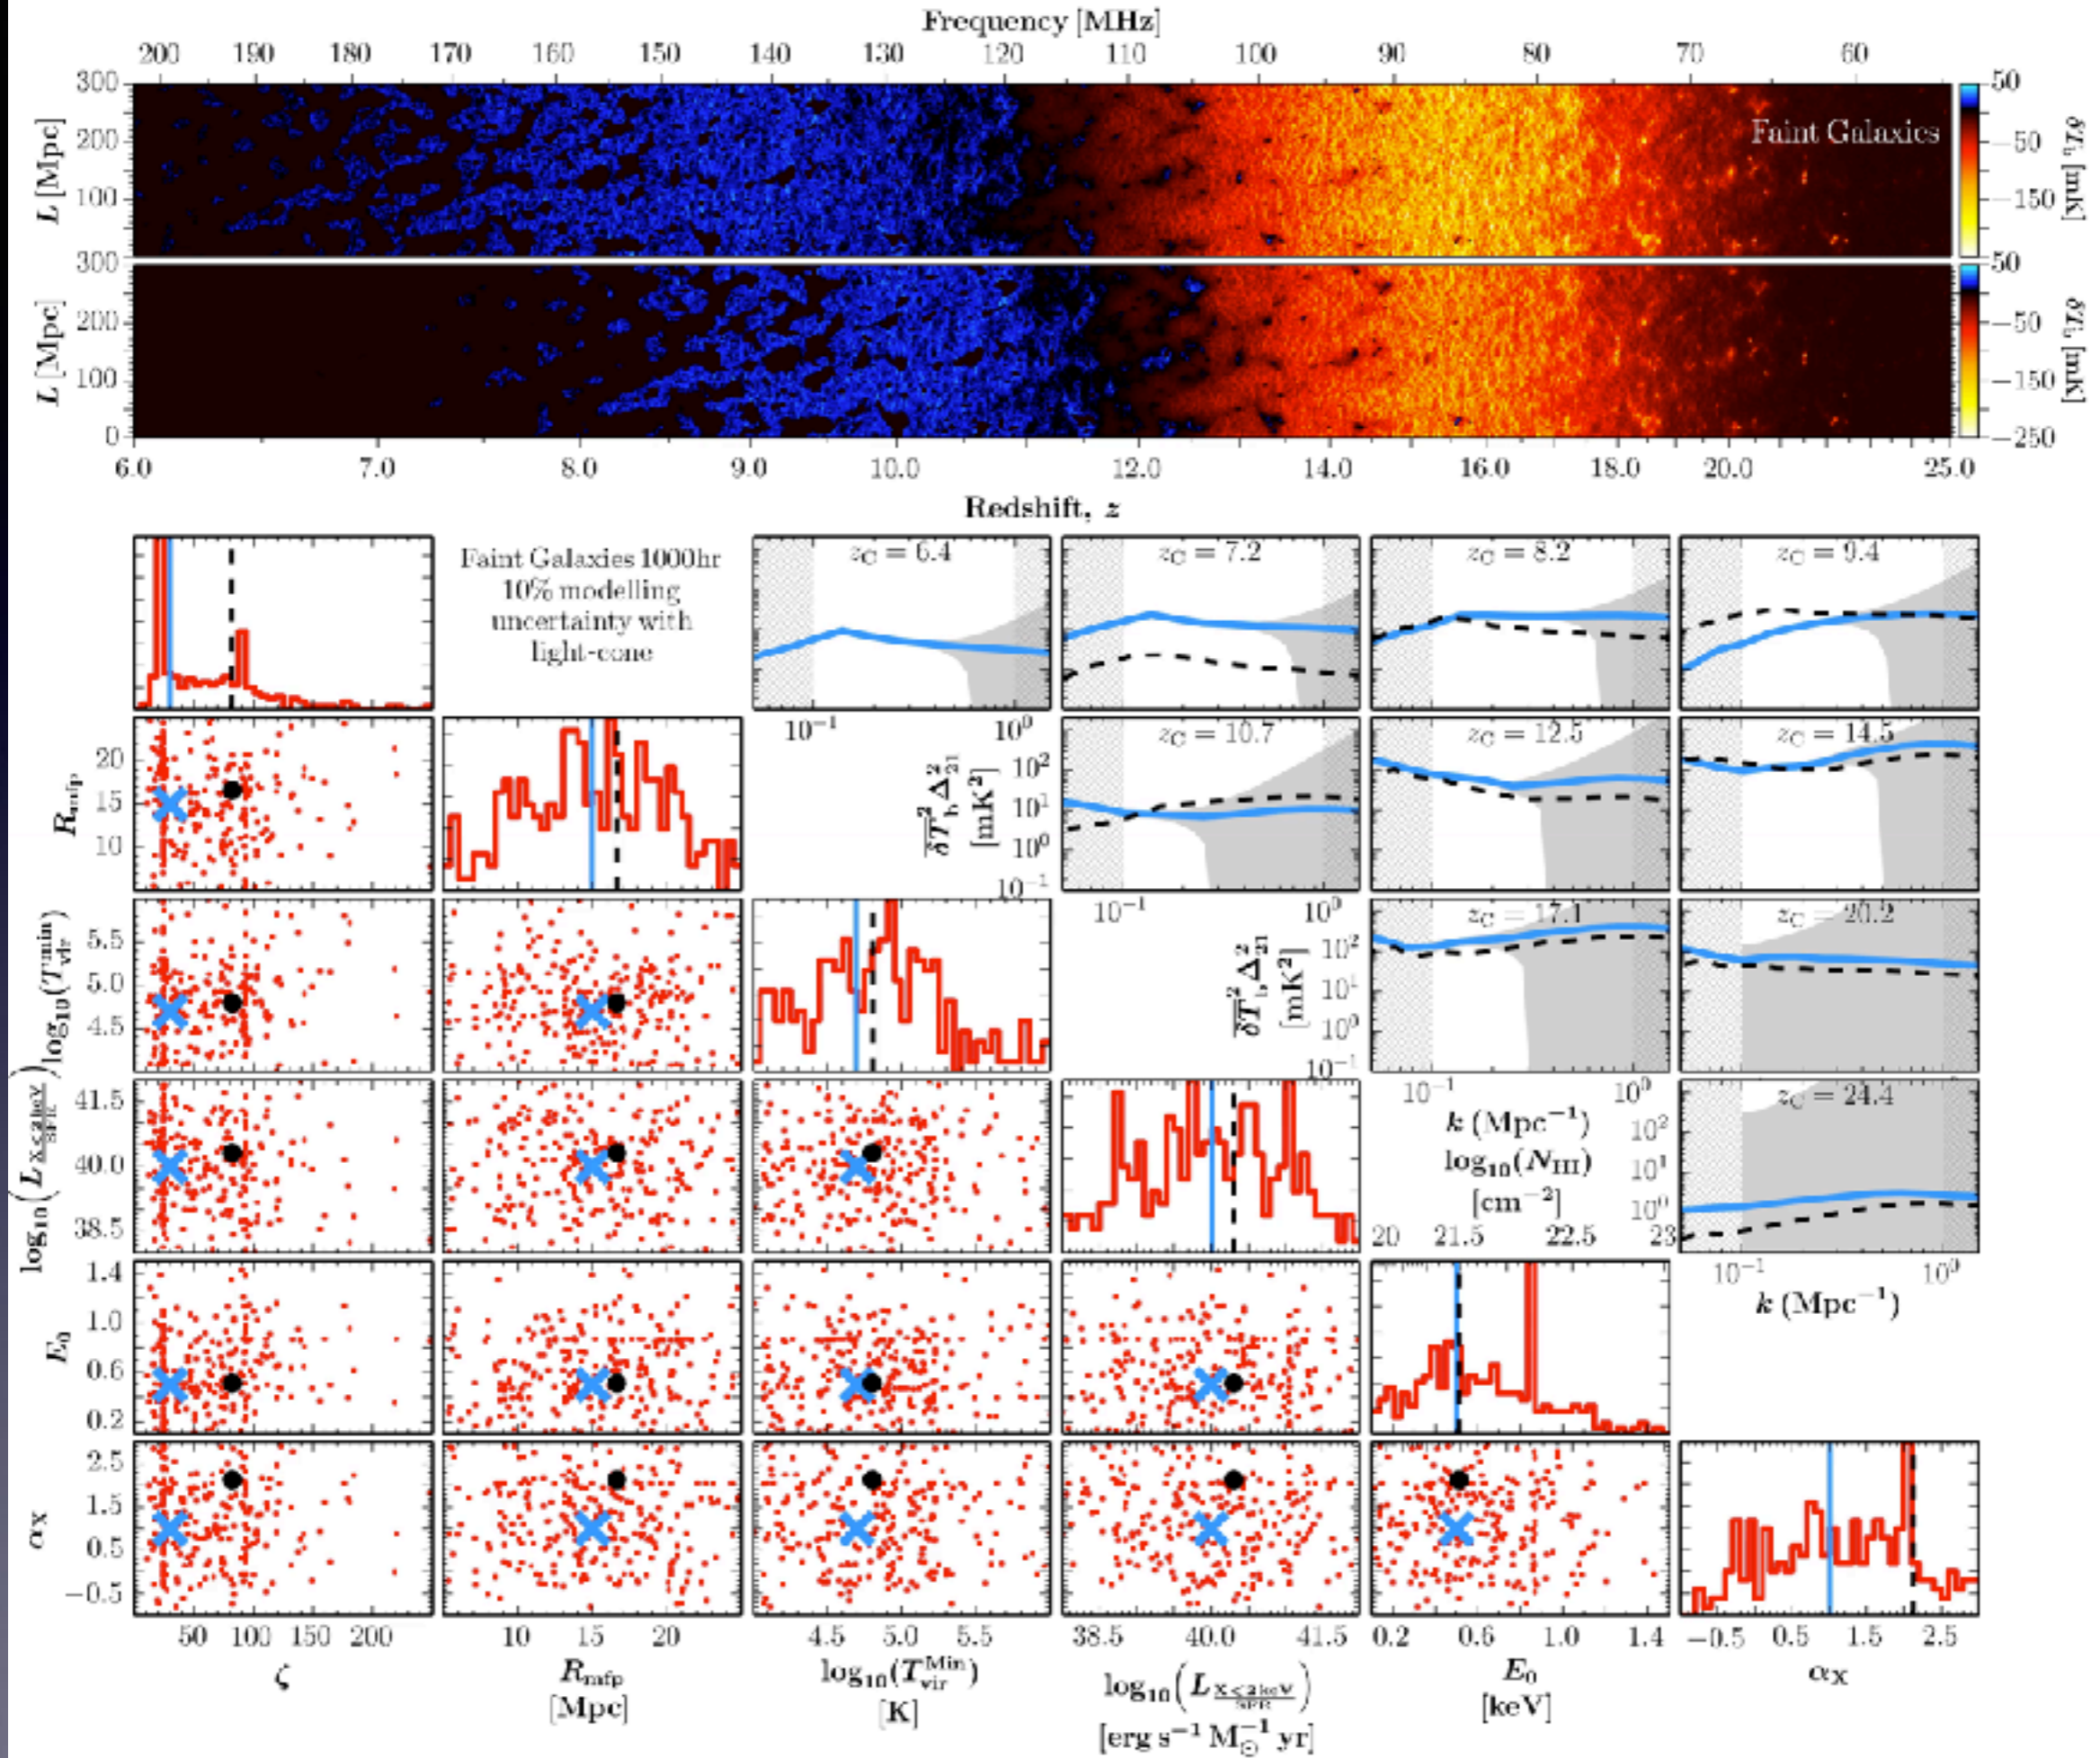

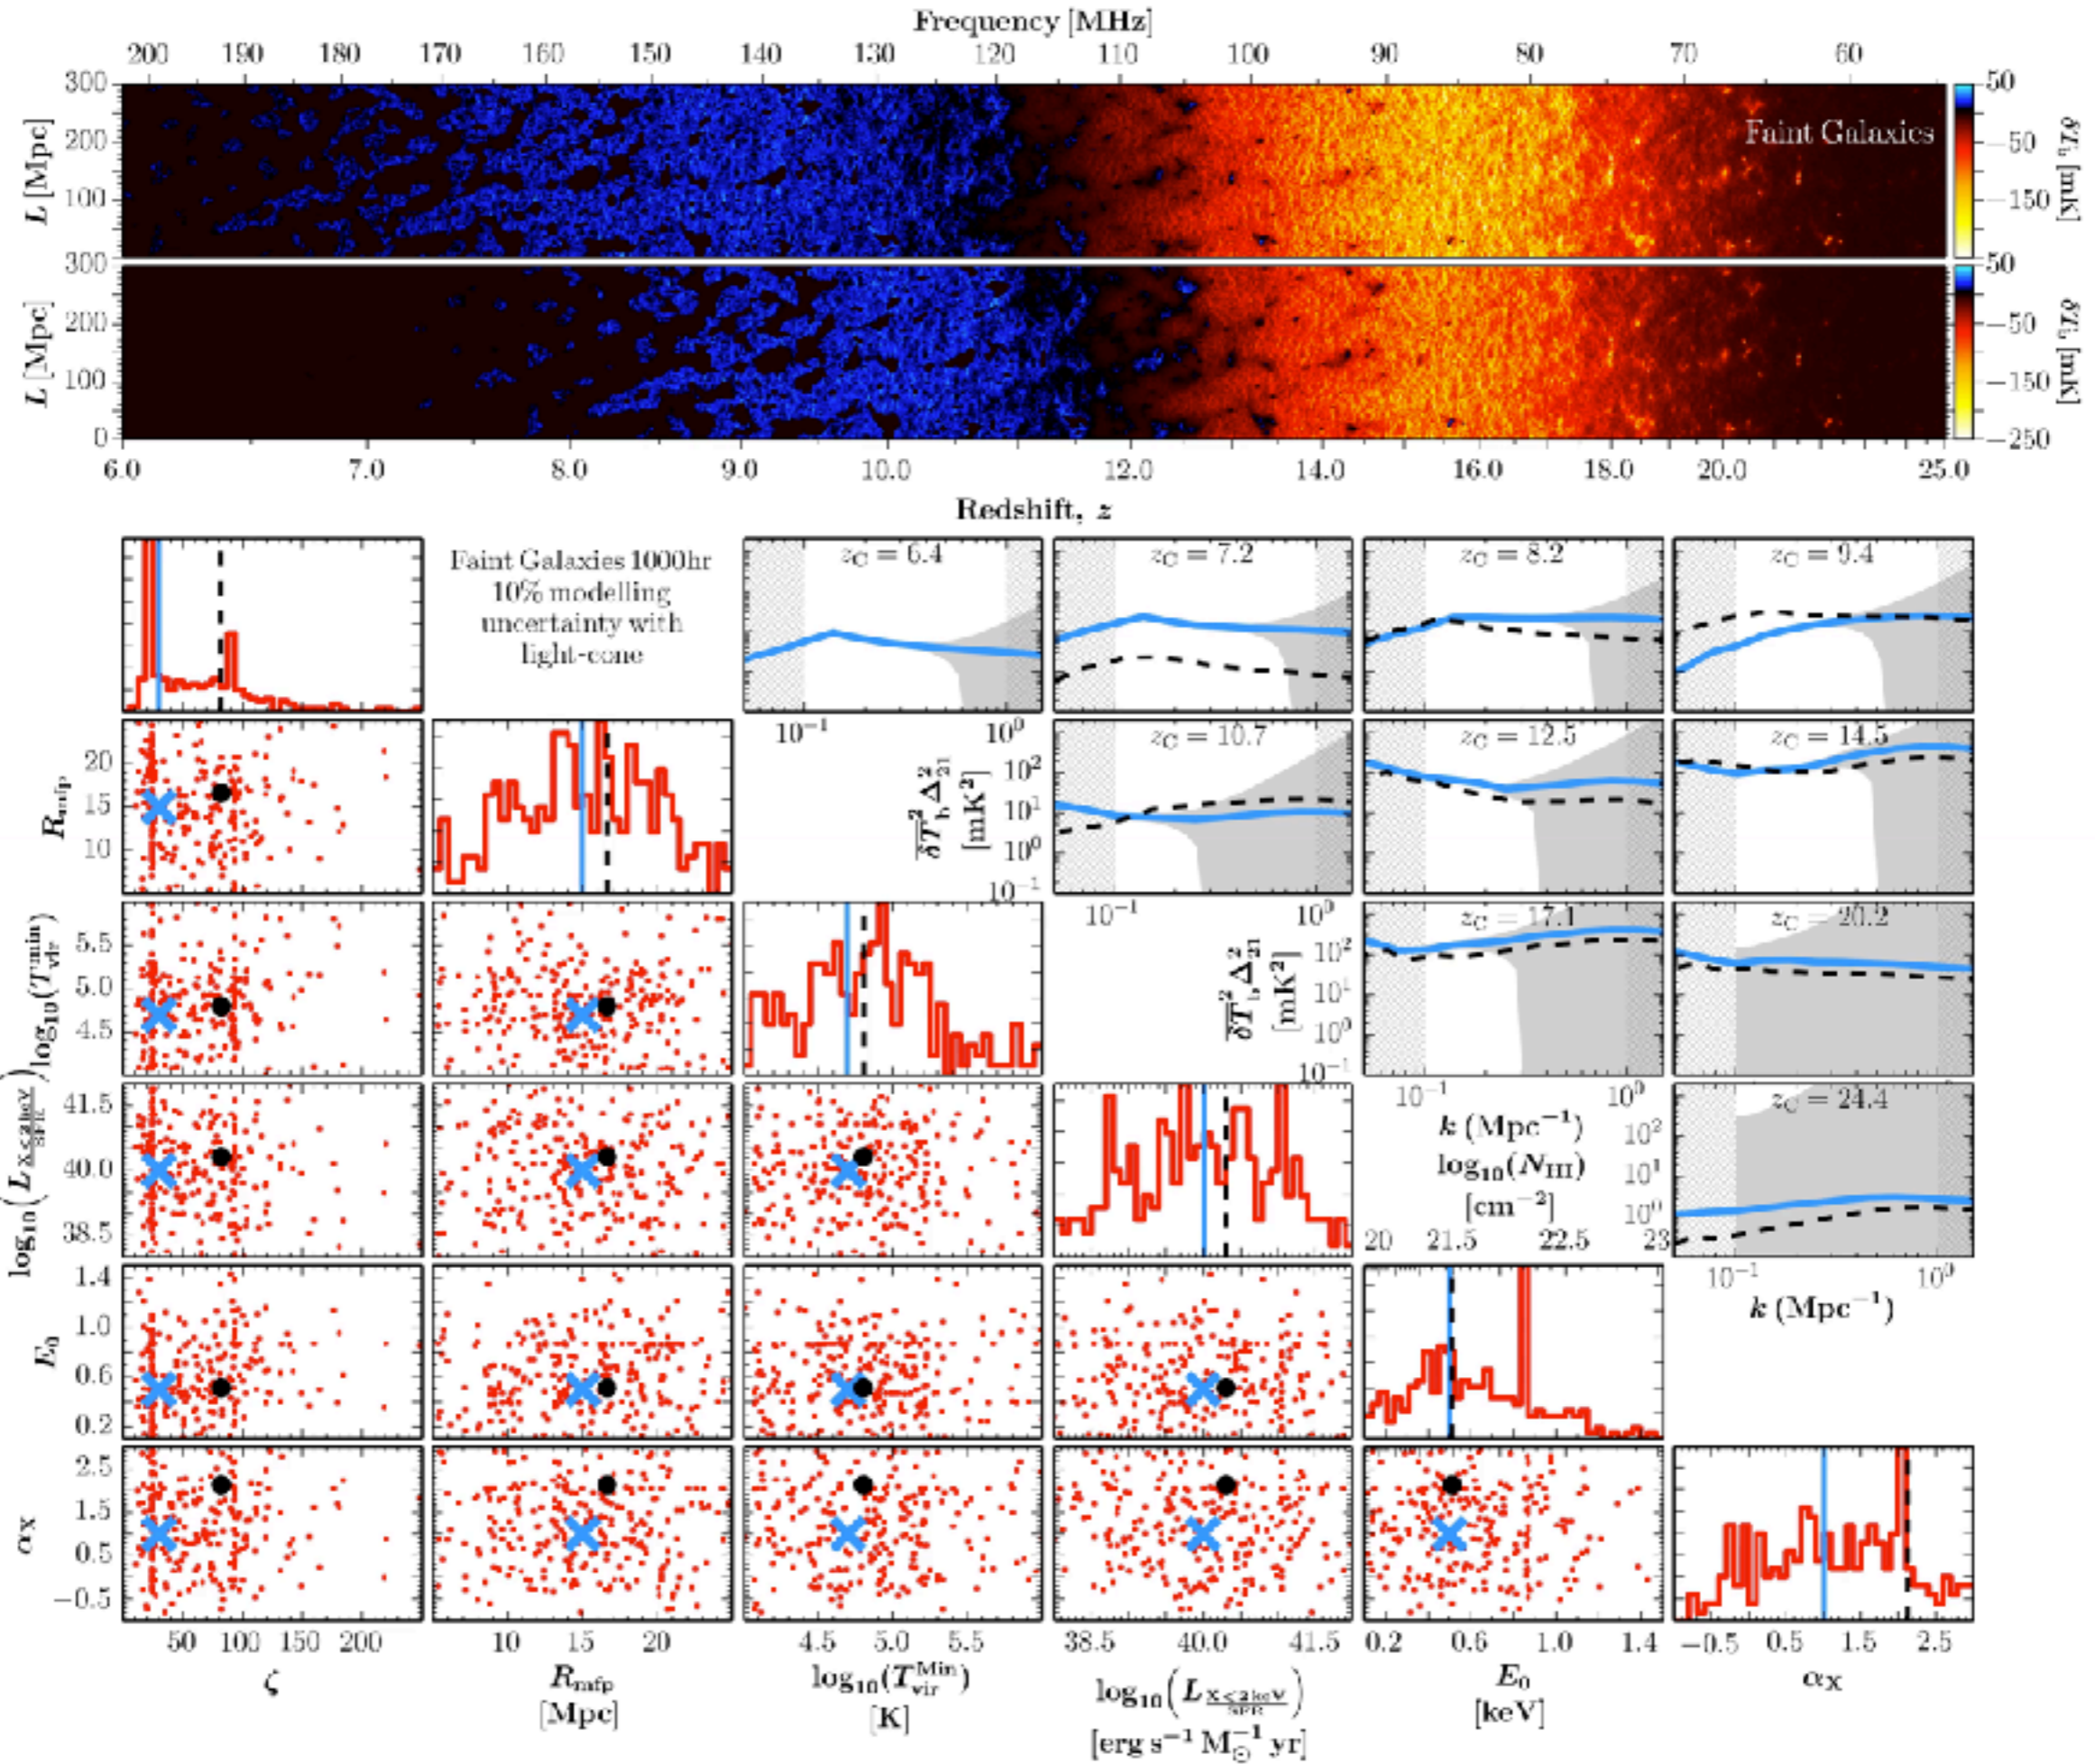

Faint Galaxies 1000hr
10% modelling
uncertainty with
light-cone

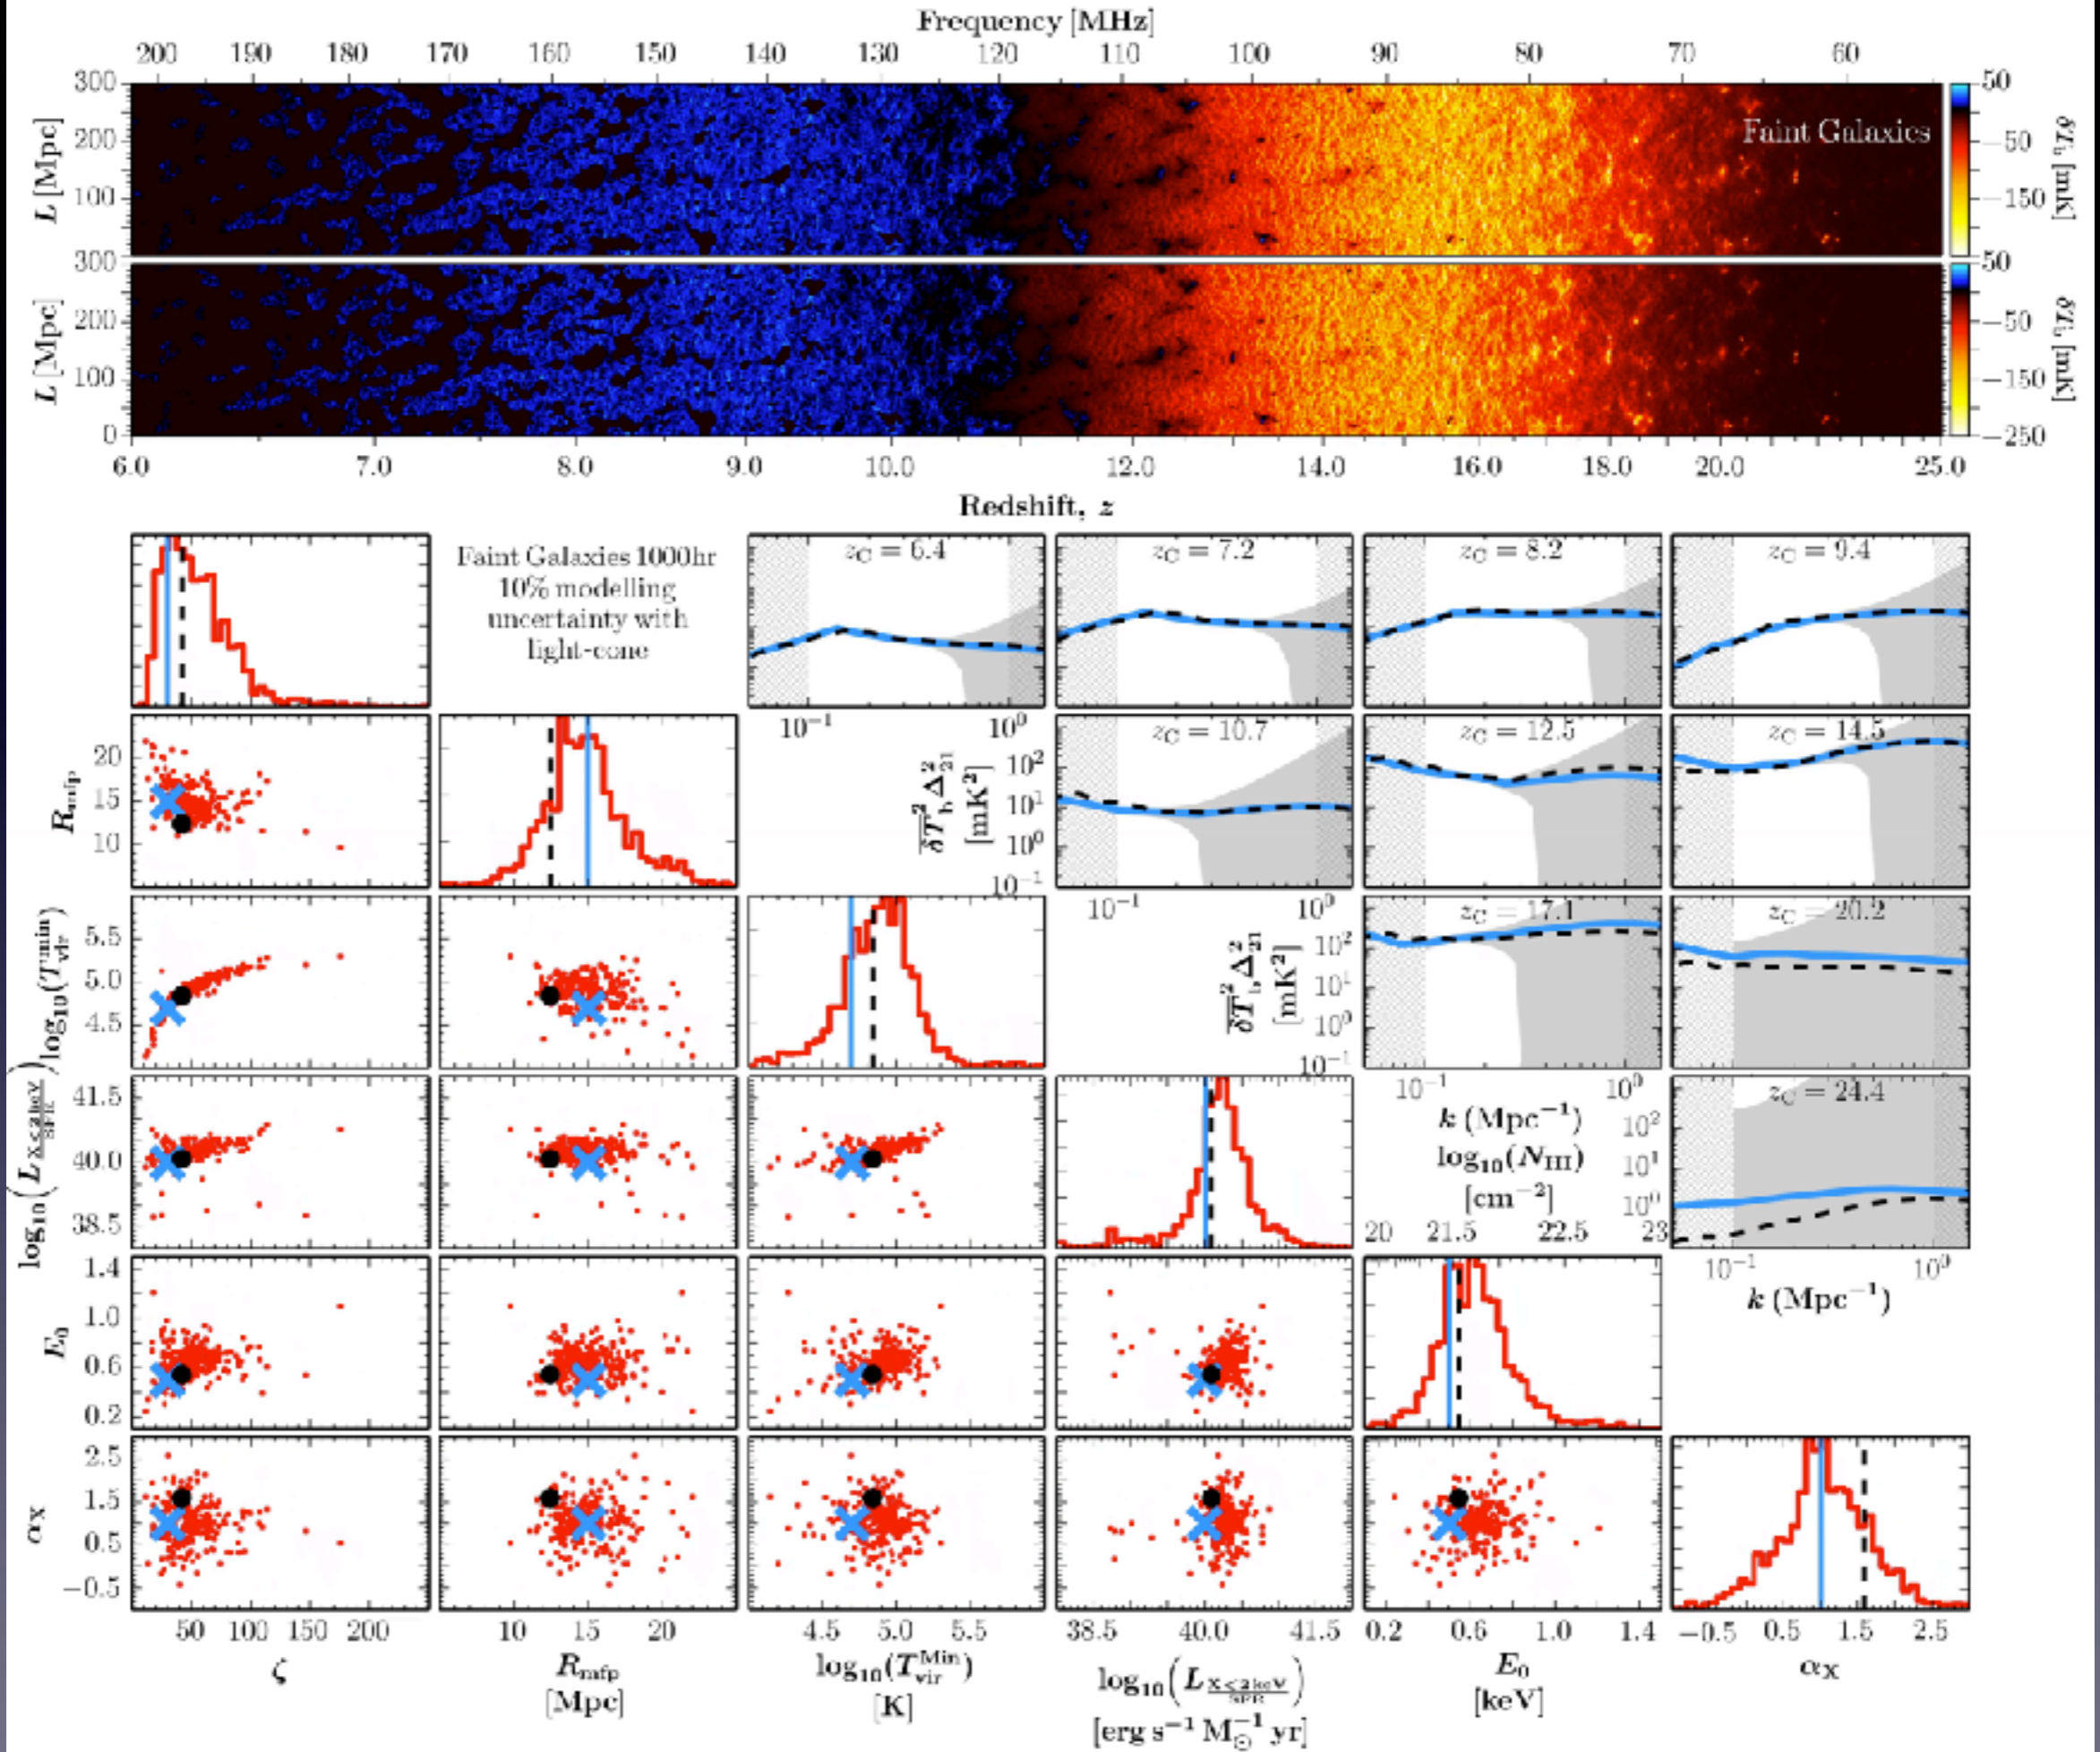

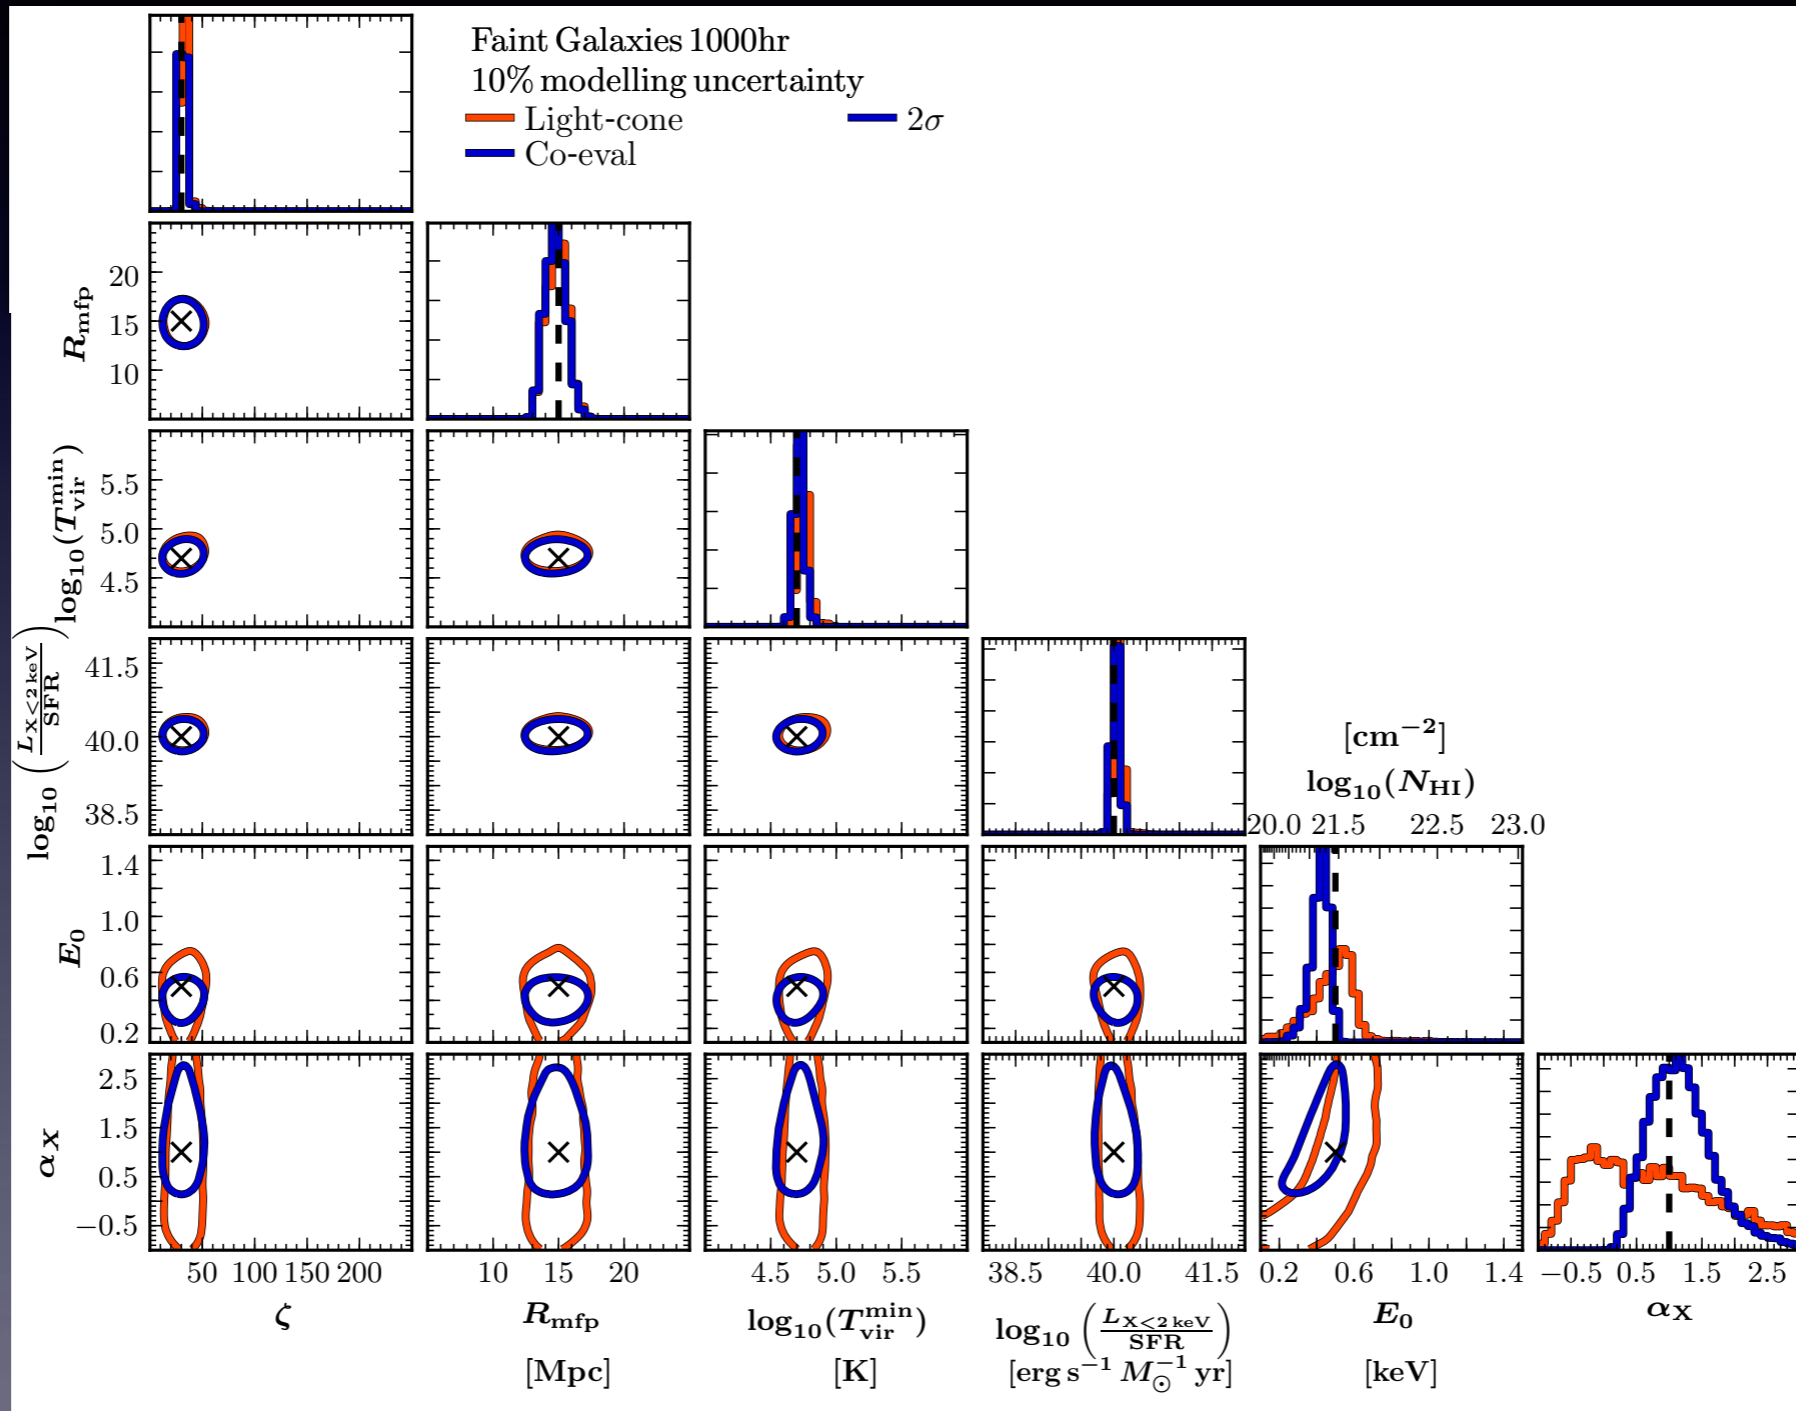

Flexibility of 21CMMC

- Produces a full, 3D 21cm light-cone at every step in the MCMC
- Enables exploring any metric describing/characterising the 21cm signal (i.e. statistical/tomographical)
- The simulated signal can be more readily manipulated/corrupted to mimic realistic observations
- Can simultaneously constrain cosmology and astrophysical parameters (e.g. Kern et al. 2017)

Investigating light-cone effects

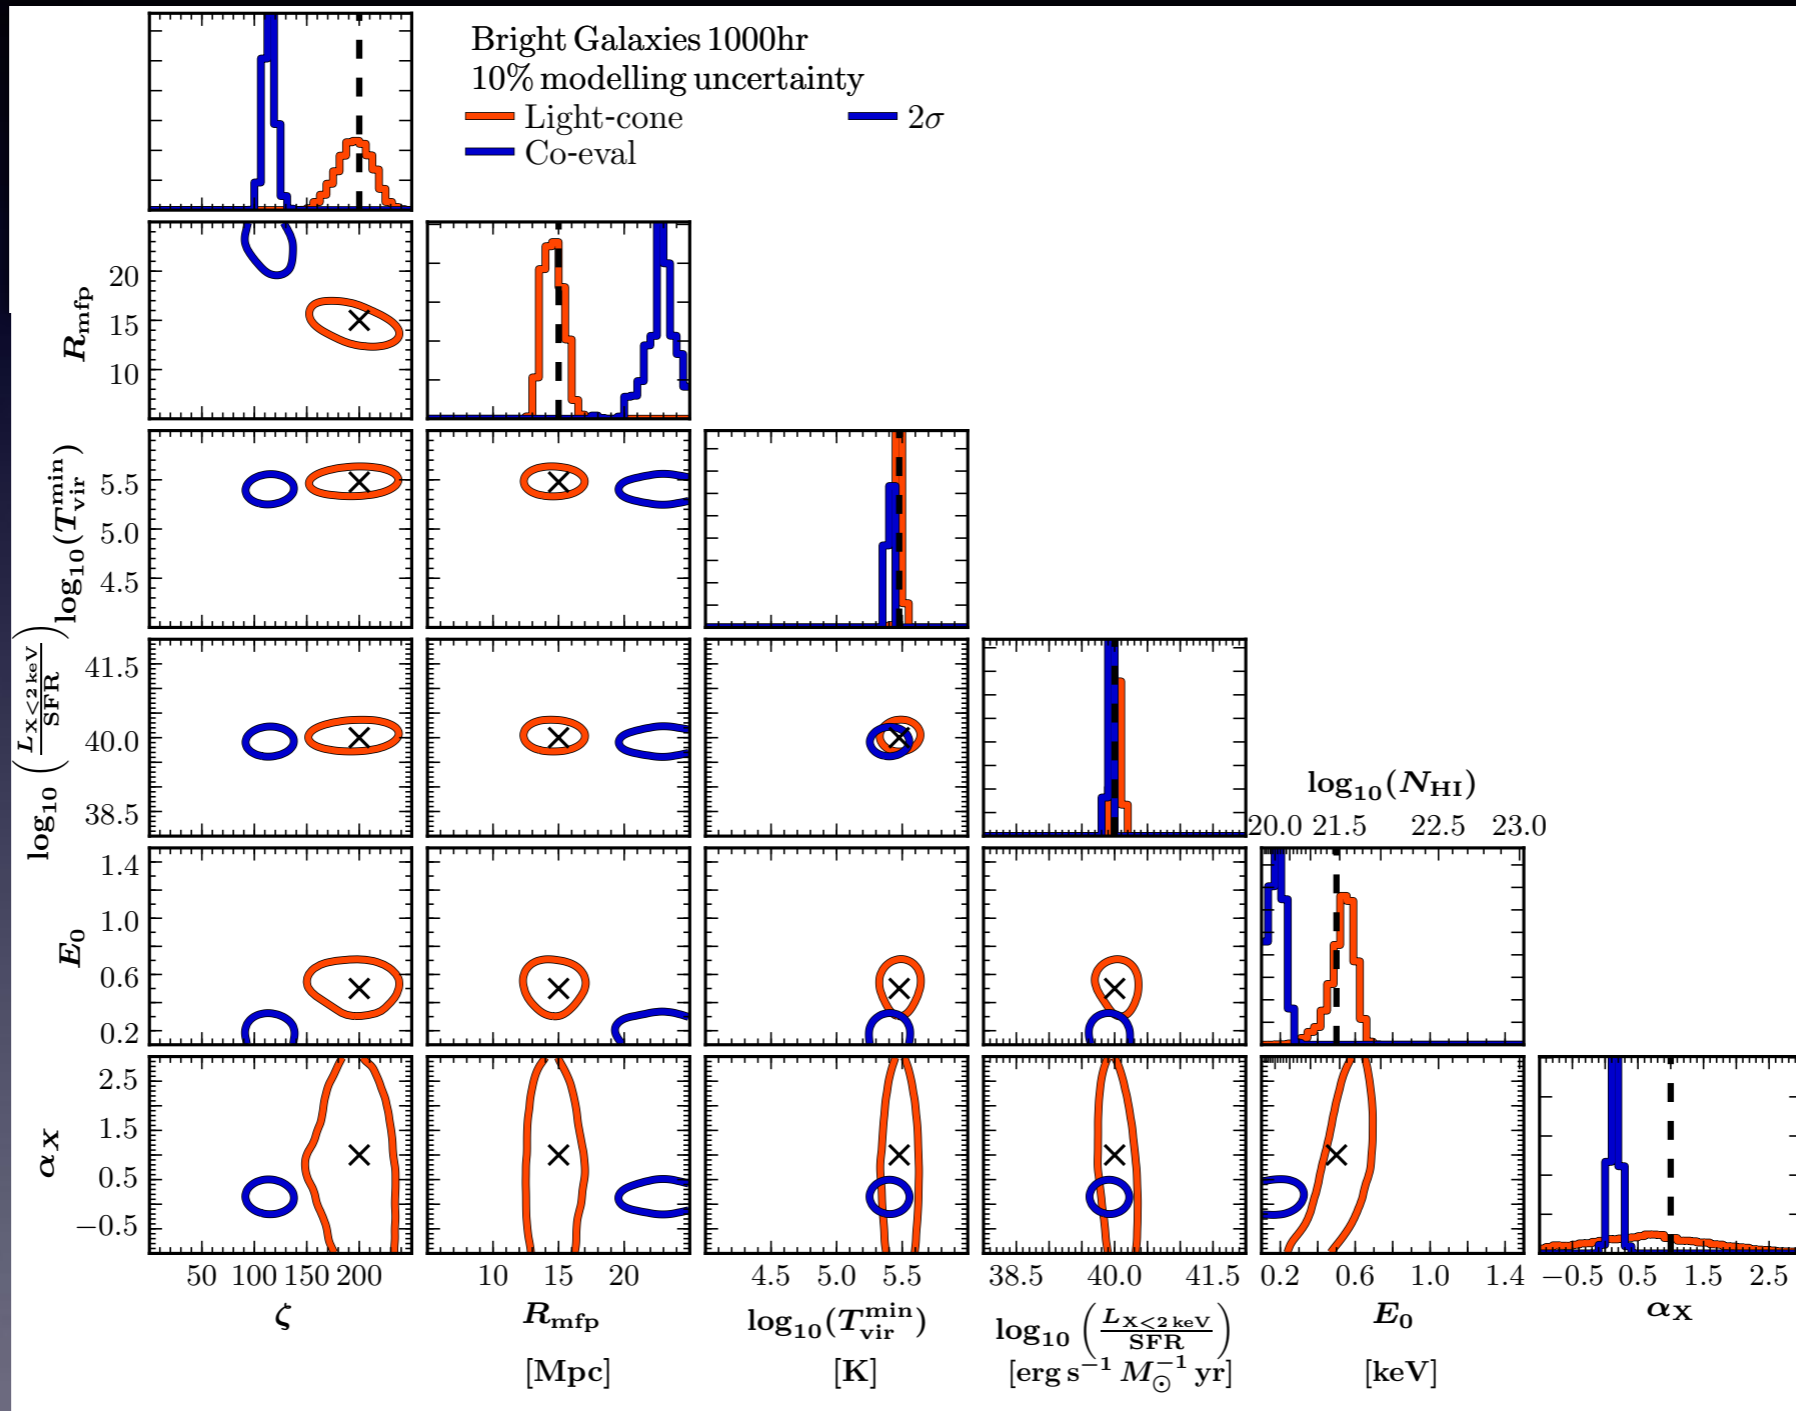

- Simulations naturally output co-evolution (co-eval) cubes
- Can quantify the bias in recovered astrophysical parameters when ignoring the light-cone effect

Investigating light-cone effects

Greig & Mesinger, in prep.

Investigating light-cone effects

Greig & Mesinger, in prep.

Conclusion

- First MCMC code to sample full 3D simulations of the EoR
- Can provide astrophysical parameter constraints on **any EoR model**, recovered from **any statistical measure** of the 21 cm signal
- New version to appear on github very shortly (<https://github.com/BradGreig/21CMMC>)
- Under going continual development, adding in more features and generalising the astrophysical parametrisation (source models etc.)
- Animations can be found at (<http://homepage.sns.it/mesinger/21CMMC>)
