

Hitting a cricket ball

A 150g cricket ball is bowled with a speed of 20 ms^{-1} . The batsman hits it straight back to the bowler at 40 ms^{-1} , and the impulsive force of bat on ball has the shape as shown.

- (a) What is the *maximum* force the bat exerts on the ball?
(b) What is the *average* force the bat exerts on the ball?

Solution: From the impulse-momentum theorem,

$$\begin{aligned} J = \Delta p &= \text{area under force curve} \\ &= \frac{1}{2} \times 0.6 \times 10^{-3} \times F_{\text{max}} \\ &= 3 \times 10^{-4} F_{\text{max}} \end{aligned}$$

Now

$$\begin{aligned} \Delta p &= \text{change in momentum} \\ &= p_f - p_i \\ &= m(v_f - v_i) \\ &= 0.15 \times (40 + 20) = 9 \text{ kg ms}^{-1} \end{aligned}$$

so equating this with the above expression for J , we get

$$3 \times 10^{-4} F_{\text{max}} = 9 \text{ kg ms}^{-1}$$

so

$$F_{\text{max}} = 9/3 \times 10^{-4} = 30,000 \text{ N}$$

the maximum force that the bat exerts on the ball.

The *average* force F_{av} is

$$F_{\text{max}} = \Delta p/t = 9/6 \times 10^{-4} = 15,000 \text{ N}$$
